

Standards for this Module

At the end of this module, each student should be able to...

- **E1: Augmented Matrices.** Translate back and forth between a system of linear equations and the corresponding augmented matrix.
- **E2: Row Reduction.** Find the equivalent augmented matrix in reduced row echelon form for a given augmented matrix.
- **E3: Solving Linear Systems.** Solve a system of linear equations.
- **E4: Homogeneous Systems.** Find a basis for the solution set of a homogeneous linear system.

Readiness Assurance Outcomes

Before beginning this module, each student should be able to...

- Determine if a system to a two-variable system of linear equations will have zero, one, or infinitely-many solutions by graphing.
- Find the unique solution to a two-variable system of linear equations by back-substitution.

Readiness Assurance Resources

The following resources will help you prepare for this module.

- <https://www.khanacademy.org/math/cc-eighth-grade-math/cc-8th-systems-topic/cc-8th-systems-graphical/a/systems-of-equations-with-graphing>
- <https://www.khanacademy.org/math/algebra/systems-of-linear-equations/solving-systems-of-equations-v/practice-using-substitution-for-systems>

Readiness Assurance Test

Choose the most appropriate response for each question.

- 1) Which of these graphs represents the following system of linear equations?

$$\begin{aligned}x + 2y &= 4 \\ 2x - 3y &= 1\end{aligned}$$

- 2) How many solutions are there for the system of linear equations represented by the following graph?

- (a) Zero (b) One (c) Two (d) Infinitely-many

- 3) How many solutions are there for the system of linear equations represented by the following graph?
(This graph represents two completely overlapping lines.)

- (a) Zero (b) One (c) Two (d) Infinitely-many

- 4) How many solutions are there for the system of linear equations represented by the following graph?
(This graph represents two parallel lines.)

- (a) Zero (b) One (c) Two (d) Infinitely-many

5) Solve the following system of linear equations.

$$y = 2x + 5$$

$$y = -x + 2$$

- (a) $(x, y) = (-1, 3)$ (b) $(x, y) = (4, -2)$ (c) There are no solutions. (d) There are infinitely-many solutions.

6) Solve the following system of linear equations.

$$x + 2y = 4$$

$$2x - 3y = 1$$

- (a) $(x, y) = (-1, 4)$ (b) $(x, y) = (2, 1)$ (c) There are no solutions. (d) There are infinitely-many solutions.

Application Activities - Day 1

Definition. A **linear equation** is an equation of the variables x_i of the form

$$a_1x_1 + a_2x_2 + \cdots + a_nx_n = b.$$

A **solution** (s_1, s_2, \dots, s_n) for a linear equation satisfies

$$a_1s_1 + a_2s_2 + \cdots + a_ns_n = b.$$

Observation. The linear equation $3x - 5y = -2$ may be graphed as a line in the xy plane.

The linear equation $x + 2y - z = 4$ may be graphed as a plane in xyz space.

Remark. In previous classes you likely assumed $x = x_1$, $y = x_2$, and $z = x_3$. However, since this course often deals with equations of four or more variables, we will almost always write our variables as x_i .

Definition. A **system of linear equations** (or a **linear system** for short) is a collection of one or more linear equations.

$$\begin{array}{ccccccc} a_{11}x_1 + a_{12}x_2 + \cdots + a_{1n}x_n & = & b_1 \\ a_{21}x_1 + a_{22}x_2 + \cdots + a_{2n}x_n & = & b_2 \\ \vdots & & \vdots \\ a_{m1}x_1 + a_{m2}x_2 + \cdots + a_{mn}x_n & = & b_m \end{array}$$

A **solution** (s_1, s_2, \dots, s_n) for a linear system satisfies

$$a_{i1}s_1 + a_{i2}s_2 + \cdots + a_{in}s_n = b_i$$

for $1 \leq i \leq m$ (that is, the solution satisfies all equations in the system).

Remark. When variables in a large linear system are missing, we prefer to write the system in one of the following standard forms:

Original linear system:

$$\begin{array}{rcl} x_1 + 3x_3 & = & 3 \\ 3x_1 - 2x_2 + 4x_3 & = & 0 \\ -x_2 + x_3 & = & -2 \end{array}$$

Verbose standard form:

$$\begin{array}{rcl} x_1 + 0x_2 + 3x_3 & = & 3 \\ 3x_1 - 2x_2 + 4x_3 & = & 0 \\ 0x_1 - x_2 + x_3 & = & -2 \end{array}$$

Concise standard form:

$$\begin{array}{rcl} x_1 & + & 3x_3 = 3 \\ 3x_1 - 2x_2 + 4x_3 & = & 0 \\ & - & x_2 + x_3 = -2 \end{array}$$

Definition. A linear system is **consistent** if there exists a solution for the system. Otherwise it is **inconsistent**.

Fact. All linear systems are either **consistent with one solution**, **consistent with infinitely-many solutions**, or **inconsistent**.

Activity. Consider the following graphs representing linear systems of two variables. Label each graph with **consistent with one solution**, **consistent with infinitely-many solutions**, or **inconsistent**.

Activity. All inconsistent linear systems contain a **contradiction**. Find a contradiction in this system by solving for x_1 in the first equation, substituting the resulting expression into the second equation, and then simplifying.

$$\begin{aligned} -x_1 + 2x_2 &= 5 \\ 2x_1 - 4x_2 &= 6 \end{aligned}$$

Activity. Consider the following consistent linear system.

$$\begin{aligned} -x_1 + 2x_2 &= -3 \\ 2x_1 - 4x_2 &= 6 \end{aligned}$$

Part X: Find three different solutions for this system.

Part X: Find a formula for x_1 in terms of x_2 that describes all possible solutions for this system. Then use it to verify the three different solutions you found in the previous activity.

Observation. Solving linear systems of two variables by graphing or substitution is reasonable for two-variable systems, but won't cut it for equations with more variables. Linear Algebra provides us several tools to make this process more efficient.

Definition. A system of m linear equations with n variables is often represented by writing its coefficients and constants in an **augmented matrix**.

$$\begin{aligned} a_{11}x_1 + a_{12}x_2 + \dots + a_{1n}x_n &= b_1 \\ a_{21}x_1 + a_{22}x_2 + \dots + a_{2n}x_n &= b_2 \\ \vdots & \\ a_{m1}x_1 + a_{m2}x_2 + \dots + a_{mn}x_n &= b_m \end{aligned} \quad \left[\begin{array}{cccc|c} a_{11} & a_{12} & \cdots & a_{1n} & b_1 \\ a_{21} & a_{22} & \cdots & a_{2n} & b_2 \\ \vdots & \vdots & \ddots & \vdots & \vdots \\ a_{m1} & a_{m2} & \cdots & a_{mn} & b_m \end{array} \right]$$

Definition. Two systems of linear equations (and their corresponding augmented matrices) are said to be **equivalent** if they share exactly the same solutions.

Activity. Following are six procedures used to manipulate an augmented matrix. Label the procedures that would result in an equivalent augmented matrix as **valid**, and label the procedures that would change the solution set of the corresponding linear system as **invalid**.

- | | |
|---|---|
| a) Swap two rows. | d) Multiply a row by a nonzero constant. |
| b) Swap two columns. | e) Add a constant multiple of one row to another row. |
| c) Add a constant to every term in a row. | f) Replace a column with zeros. |

(Instructor Note:) This activity could be ran as a card sort.

Definition. The following **row operations** produce equivalent augmented matrices:

1. Swap two rows.
2. Multiply a row by a nonzero constant.
3. Add a constant multiple of one row to another row.

Whenever two matrices A, B are equivalent (so whenever we do any of these operations), we write $A \sim B$.

Activity. Show that the following two linear systems:

$3x_1 - 2x_2 + 13x_3 = 6$	$x_1 - x_2 + 5x_3 = 1$
$2x_1 - 2x_2 + 10x_3 = 2$	$x_2 - 2x_3 = 3$
$-1x_1 + 3x_2 - 6x_3 = 11$	$x_3 = 2$

are equivalent by converting the first system to an augmented matrix, and then performing the following row operations to obtain an augmented matrix equivalent to the second system.

- | | |
|---|--------------------------------------|
| 1. Swap R_1 (first row) and R_2 (second row). | 4. Add $-3R_1$ to R_2 . |
| 2. Multiply R_2 by $\frac{1}{2}$. | 5. Add $-2R_2$ to R_3 . |
| 3. Add R_1 to R_3 . | 6. Multiply R_3 by $\frac{1}{3}$. |
-

Definition. The **leading term** of a matrix row is its first nonzero term. A matrix is in **row echelon form** if all leading terms are 1, the leading term of every row is farther right than every leading term on a higher row, and all zero rows are at the bottom of the matrix.

Activity. Reproduce the steps that manipulated the matrix

$$\left[\begin{array}{ccc|c} 3 & -2 & 13 & 6 \\ 2 & -2 & 10 & 2 \\ -1 & 3 & -6 & 11 \end{array} \right] \sim \left[\begin{array}{ccc|c} 1 & -1 & 5 & 1 \\ 0 & 1 & -2 & 3 \\ 0 & 0 & 1 & 2 \end{array} \right]$$

into row echelon form by using the following algorithm.

1. Identify the top cell of the first non-zero column as your **pivot position**; you will ignore anything in the matrix that is above or left of your current pivot position.
 2. If the pivot position contains a 0, swap its row with a lower row that does not contain a 0 in its column.
 3. Divide the pivot row by the term in pivot position to change the pivot term to 1. (If convenient, you can first swap the pivot row with a lower row to make this division easier.)
 4. Add multiples of the pivot row to all lower rows so that all terms below pivot position become 0.
 5. Move your pivot position down and right one step.
 6. If all terms in and below pivot position are zero, move your pivot position right. Repeat this step as needed.
 7. If the matrix is not yet in row echelon form, return to Step 2.
-

Definition. A matrix is in **reduced row echelon form** if it is in row echelon form and all terms above leading terms are 0.

Activity. Show that the following two linear systems:

$$\begin{array}{rcl} x_1 - x_2 + 5x_3 & = & 1 \\ x_2 - 2x_3 & = & 3 \\ x_3 & = & 2 \end{array} \qquad \begin{array}{rcl} x_1 & = & -2 \\ x_2 & = & 7 \\ x_3 & = & 2 \end{array}$$

are equivalent by converting the first system to an augmented matrix, and then performing the following row operations to obtain an augmented matrix equivalent to the second system.

1. Add $2R_3$ to R_2 .
2. Add $-5R_3$ to R_1 .
3. Add R_2 to R_1 .

This shows that the original linear system is consistent with a single solution $(x_1, x_2, x_3) = (-2, 7, 2)$.

Activity. Verify that $(x_1, x_2, x_3) = (-2, 7, 2)$ is a solution to the linear system

$$\begin{array}{rcl} 3x_1 - 2x_2 + 13x_3 & = & 6 \\ 2x_1 - 2x_2 + 10x_3 & = & 2 \\ -1x_1 + 3x_2 - 6x_3 & = & 11 \end{array}$$

by plugging the solution into each equation.

Activity. Reproduce the steps that manipulated the matrix

$$\left[\begin{array}{ccc|c} 1 & -1 & 5 & 1 \\ 0 & 1 & -2 & 3 \\ 0 & 0 & 1 & 2 \end{array} \right] \sim \left[\begin{array}{ccc|c} 1 & 0 & 0 & -2 \\ 0 & 1 & 0 & 7 \\ 0 & 0 & 1 & 2 \end{array} \right]$$

into reduced row echelon form by adding multiples of lower rows into higher rows, zeroing out all terms above leading terms.

Fact. Every augmented matrix A reduces to a unique reduced row echelon form matrix. This matrix is denoted as $\text{RREF}(A)$.

Definition. The following algorithm that reduces A to $\text{RREF}(A)$ is known as **Gauss-Jordan elimination**.

1. Identify the top cell of the first non-zero column as your **pivot position**; you will ignore anything in the matrix that is above or left of your current pivot position.
2. If the pivot position contains a 0, swap its row with a lower row that does not contain a 0 in its column.
3. Divide the pivot row by the term in pivot position to change the pivot term to 1. (If convenient, you can first swap the pivot row with a lower row to make this division easier.)
4. Add multiples of the pivot row to all lower rows so that all terms below pivot position become 0.
5. Move your pivot position down and right one step.
6. If all terms in and below pivot position are zero, move your pivot position right. Repeat this step as needed.
7. If the matrix is not yet in row echelon form, return to Step 2.
8. Finally, add multiples of lower rows into higher rows, zeroing out all terms above leading terms.

Activity. Find $\text{RREF}(A)$ where

$$A = \left[\begin{array}{cccc|c} -1 & 1 & -3 & 2 & 0 \\ 2 & -1 & 5 & 3 & -11 \\ 3 & 2 & 4 & 1 & 1 \\ 0 & 1 & -1 & 1 & 1 \end{array} \right].$$

Definition. The columns of $\text{RREF}(A)$ without a leading term represent **free variables** of the linear system modeled by A . The other **bounded variables** can be expressed in terms of free variables to represent all possible solutions to the linear system modeled by A .

Activity. Given the linear system and its equivalent augmented matrices

$$\begin{array}{rcl} -x_1 + x_2 - 3x_3 + 2x_4 & = & 0 \\ 2x_1 - x_2 + 5x_3 + 3x_4 & = & -11 \\ 3x_1 + 2x_2 + 4x_3 + x_4 & = & 1 \\ x_2 - x_3 + x_4 & = & 1 \end{array} \qquad \left[\begin{array}{cccc|c} -1 & 1 & -3 & 2 & 0 \\ 2 & -1 & 5 & 3 & -11 \\ 3 & 2 & 4 & 1 & 1 \\ 0 & 1 & -1 & 1 & 1 \end{array} \right] \sim \left[\begin{array}{cccc|c} 1 & 0 & 2 & 0 & -1 \\ 0 & 1 & -1 & 0 & 3 \\ 0 & 0 & 0 & 1 & -2 \\ 0 & 0 & 0 & 0 & 0 \end{array} \right]$$

describe all solutions to the linear system by setting each of the bounded variables x_1, x_2, x_4 equal to an expression in terms of the free variable x_3 .

Remark. It's not necessary to completely find $\text{RREF}(A)$ to deduce that a linear system is inconsistent.

Activity. Find the contradiction in the inconsistent linear system

$$2x_1 - 3x_2 = 17$$

$$x_1 + 2x_2 = -2$$

$$-x_1 - x_2 = 1$$

by considering the following equivalent augmented matrices:

$$\left[\begin{array}{cc|c} 2 & -3 & 17 \\ 1 & 2 & -2 \\ -1 & -1 & 1 \end{array} \right] \sim \left[\begin{array}{cc|c} 1 & 2 & -2 \\ 0 & 1 & 3 \\ 0 & 0 & 2 \end{array} \right].$$

Definition. A **homogeneous system** is a linear system satisfying $b_i = 0$, that is, it is a linear system of the form

$$a_{11}x_1 + a_{12}x_2 + \dots + a_{1n}x_n = 0$$

$$a_{21}x_1 + a_{22}x_2 + \dots + a_{2n}x_n = 0$$

$$\vdots \quad \quad \quad \vdots \quad \quad \quad \vdots \quad \quad \vdots$$

$$a_{m1}x_1 + a_{m2}x_2 + \dots + a_{mn}x_n = 0$$

Activity. Prove that all homogeneous systems are consistent. (Hint: Find an obvious solution that satisfies every homogeneous system.)

Readiness Assurance Outcomes

Before beginning this module, each student should be able to...

- Solve a system of linear equations (including finding a basis of the solution space if it is homogeneous) by interpreting as an augmented matrix and row reducing (**Standard(s) E1, E2, E3, E4**).
- State the definition of linear independence, and determine if a set of vectors is linearly dependent or independent (**Standard(s) V5**).
- State the definition of a spanning set, and determine if a set of vectors spans a vector space or subspace (**Standard(s) V6, V7**).
- State the definition of a basis, and determine if a set of vectors is a basis (**Standard(s) V8, V9**).

Readiness Assurance Resources

The following resources will help you prepare for this module.

- Review the supporting Standards listed above.

Readiness Assurance Test

Choose the most appropriate response for each question.

- 1) Which of the following is a solution to the system of linear equations

$$\begin{aligned}x + 3y - z &= 2 \\ 2x + 8y + 3z &= -1 \\ -x - y + 9z &= -10\end{aligned}$$

- (a) $\begin{bmatrix} 1 \\ 1 \\ 0 \end{bmatrix}$ (b) $\begin{bmatrix} 0 \\ 1 \\ -1 \end{bmatrix}$ (c) $\begin{bmatrix} 1 \\ 0 \\ -1 \end{bmatrix}$ (d) $\begin{bmatrix} 1 \\ -1 \\ 1 \end{bmatrix}$

- 2) Find a basis for the solution set of the following homogeneous system of linear equations

$$\begin{aligned}x + 2y + -z - w &= 0 \\ -2x - 4y + 3z + 5w &= 0\end{aligned}$$

- (a) $\left\{ \begin{bmatrix} 2 \\ 1 \\ 0 \\ 0 \end{bmatrix}, \begin{bmatrix} 2 \\ 0 \\ 3 \\ 1 \end{bmatrix} \right\}$ (b) $\left\{ \begin{bmatrix} 2 \\ 2 \\ 0 \\ 0 \end{bmatrix}, \begin{bmatrix} 0 \\ 0 \\ 3 \\ 0 \end{bmatrix} \right\}$ (c) $\left\{ \begin{bmatrix} 2 \\ 1 \\ 3 \\ 1 \end{bmatrix} \right\}$ (d) None of these are a basis.

- 3) Determine which property applies to the set of vectors

$$\left\{ \begin{bmatrix} 1 \\ 0 \\ 0 \end{bmatrix}, \begin{bmatrix} 0 \\ 1 \\ 0 \end{bmatrix} \right\} \subset \mathbb{R}^3.$$

- (a) It does not span and is linearly dependent
(b) It does not span and is linearly independent
(c) It spans but it is linearly dependent
(d) It is a basis of \mathbb{R}^3 .

- 4) Determine which property applies to the set of vectors

$$\left\{ \begin{bmatrix} 1 \\ 0 \\ 0 \end{bmatrix}, \begin{bmatrix} 2 \\ 1 \\ 0 \end{bmatrix}, \begin{bmatrix} 1 \\ 1 \\ 3 \end{bmatrix} \right\} \subset \mathbb{R}^3.$$

- (a) It does not span and is linearly dependent
(b) It does not span and is linearly independent
(c) It spans but it is linearly dependent
(d) It is a basis of \mathbb{R}^3 .

- 5) Determine which property applies to the set of vectors

$$\left\{ \begin{bmatrix} 1 \\ 0 \\ 0 \end{bmatrix}, \begin{bmatrix} -2 \\ 0 \\ -2 \end{bmatrix}, \begin{bmatrix} 1 \\ 1 \\ 0 \end{bmatrix}, \begin{bmatrix} 3 \\ 3 \\ -3 \end{bmatrix} \right\} \subset \mathbb{R}^3.$$

- (a) It does not span and is linearly dependent
- (b) It does not span and is linearly independent
- (c) It spans but it is linearly dependent
- (d) It is a basis of \mathbb{R}^3 .

6) Determine which property applies to the set of vectors

$$\left\{ \begin{bmatrix} 2 \\ 2 \\ -1 \end{bmatrix}, \begin{bmatrix} -3 \\ 1 \\ -2 \end{bmatrix}, \begin{bmatrix} 1 \\ 5 \\ -4 \end{bmatrix} \right\} \subset \mathbb{R}^3.$$

- (a) It does not span and is linearly dependent
- (b) It does not span and is linearly independent
- (c) It spans but it is linearly dependent
- (d) It is a basis of \mathbb{R}^3 .

7) Find a basis for the subspace of \mathbb{R}^4 spanned by the vectors ...

8) Suppose you know that every vector in \mathbb{R}^5 can be written as a linear combination of the vectors $\{\vec{v}_1, \dots, \vec{v}_n\}$. What can you conclude about n ?

- (a) $n \leq 5$
- (b) $n = 5$
- (c) $n \geq 5$
- (d) n could be any positive integer

9) Suppose you know that every vector in \mathbb{R}^5 can be written uniquely as a linear combination of the vectors $\{\vec{v}_1, \dots, \vec{v}_n\}$. What can you conclude about n ?

- (a) $n \leq 5$
- (b) $n = 5$
- (c) $n \geq 5$
- (d) n could be any positive integer

10) Suppose you know that every vector in \mathbb{R}^5 can be written uniquely as a linear combination of the vectors $\{\vec{v}_1, \dots, \vec{v}_n\}$. What can you conclude about the set $\{\vec{v}_1, \dots, \vec{v}_n\}$?

- (a) It does not span and is linearly dependent
- (b) It does not span and is linearly independent
- (c) It spans but it is linearly dependent
- (d) It is a basis of \mathbb{R}^3 .

Application Activities - Day 1

Definition. A **linear transformation** is a map between vector spaces that preserves the vector space operations. More precisely, if V and W are vector spaces, a map $T : V \rightarrow W$ is called a linear transformation if

1. $T(\vec{v} + \vec{w}) = T(\vec{v}) + T(\vec{w})$ for any $\vec{v}, \vec{w} \in V$
2. $T(c\vec{v}) = cT(\vec{v})$ for any $c \in \mathbb{R}$, $\vec{v} \in V$.

In other words, a map is linear if one can do vector space operations before applying the map or after, and obtain the same answer.

V is called the **domain** of T and W is called the **co-domain** of T .

Activity. Determine if each of the following maps are linear transformations

- (a) $T_1 : \mathbb{R}^2 \rightarrow \mathbb{R}$ given by $T_1 \left(\begin{bmatrix} a \\ b \end{bmatrix} \right) = \sqrt{a^2 + b^2}$
- (b) $T_2 : \mathbb{R}^3 \rightarrow \mathbb{R}^2$ given by $T_2 \left(\begin{bmatrix} x \\ y \\ z \end{bmatrix} \right) = \begin{bmatrix} x - z \\ y \end{bmatrix}$
- (c) $T_3 : \mathcal{P}_d \rightarrow \mathcal{P}_{d-1}$ given by $T_3(f(x)) = f'(x)$.
- (d) $T_4 : C(\mathbb{R}) \rightarrow C(\mathbb{R})$ given by $T_4(f(x)) = f(-x)$
- (e) $T_5 : \mathcal{P} \rightarrow \mathcal{P}$ given by $T_5(f(x)) = f(x) + x^2$

Activity. Suppose $T : \mathbb{R}^3 \rightarrow \mathbb{R}^2$ is a linear transformation, and you know $T \left(\begin{bmatrix} 1 \\ 0 \\ 0 \end{bmatrix} \right) = \begin{bmatrix} 2 \\ 1 \end{bmatrix}$ and $T \left(\begin{bmatrix} 0 \\ 0 \\ 1 \end{bmatrix} \right) = \begin{bmatrix} -3 \\ 2 \end{bmatrix}$. Compute each of the following:

- (a) $T \left(\begin{bmatrix} 3 \\ 0 \\ 0 \end{bmatrix} \right)$
 - (b) $T \left(\begin{bmatrix} 0 \\ 0 \\ -2 \end{bmatrix} \right)$
 - (c) $T \left(\begin{bmatrix} 1 \\ 0 \\ 1 \end{bmatrix} \right)$
 - (d) $T \left(\begin{bmatrix} -2 \\ 0 \\ 5 \end{bmatrix} \right)$
-

Activity. Suppose $T : \mathbb{R}^4 \rightarrow \mathbb{R}^3$ is a linear transformation. What is the smallest number of vectors needed to determine T ? In other words, what is the smallest number n such that there are $\vec{v}_1, \dots, \vec{v}_n \in \mathbb{R}^4$ and given $T(\vec{v}_1), \dots, T(\vec{v}_n)$ you can determine $T(\vec{w})$ for *any* $\vec{w} \in \mathbb{R}^4$?

Observation. Fix an ordered basis for V . Since every vector can be written *uniquely* as a linear combination of basis vectors, a linear transformation $T : V \rightarrow W$ corresponds exactly to a choice of where each basis vector goes. For convenience, we can thus encode a linear transformation as a matrix, with one column for the image of each basis vector (in order).

Activity. Let $T : \mathbb{R}^3 \rightarrow \mathbb{R}^2$ be a linear transformation with

$$T\left(\begin{bmatrix} 1 \\ 0 \\ 0 \end{bmatrix}\right) = \begin{bmatrix} 3 \\ 2 \end{bmatrix} \qquad T\left(\begin{bmatrix} 0 \\ 1 \\ 0 \end{bmatrix}\right) = \begin{bmatrix} -1 \\ 4 \end{bmatrix} \qquad T\left(\begin{bmatrix} 0 \\ 0 \\ 1 \end{bmatrix}\right) = \begin{bmatrix} 5 \\ 0 \end{bmatrix}$$

Write the matrix corresponding to this linear transformation with respect to the standard ordered basis.

Activity. Let $T : \mathbb{R}^3 \rightarrow \mathbb{R}^2$ be a linear transformation with

$$T\left(\begin{bmatrix} 1 \\ 0 \\ 0 \end{bmatrix}\right) = \begin{bmatrix} 3 \\ 2 \end{bmatrix} \qquad T\left(\begin{bmatrix} 0 \\ 1 \\ 0 \end{bmatrix}\right) = \begin{bmatrix} -1 \\ 4 \end{bmatrix} \qquad T\left(\begin{bmatrix} 0 \\ 0 \\ 1 \end{bmatrix}\right) = \begin{bmatrix} 5 \\ 0 \end{bmatrix}$$

Write the matrix corresponding to this linear transformation with respect to the ordered basis

$$\left\{ \begin{bmatrix} 2 \\ 1 \\ 1 \end{bmatrix}, \begin{bmatrix} -1 \\ -1 \\ 3 \end{bmatrix}, \begin{bmatrix} 0 \\ 1 \\ 2 \end{bmatrix} \right\}$$

Activity. Let $D : \mathcal{P}_3 \rightarrow \mathcal{P}_2$ be the derivative map (recall this is a linear transformation). Write the matrix corresponding to D with respect to the ordered basis $\{1, x, x^2, x^3\}$.

Application Activities - Day 2

Definition. Let $T : V \rightarrow W$ be a linear transformation.

- T is called **injective** or **one-to-one** if T does not map two distinct values to the same place. More precisely, T is injective if $T(\vec{v}) \neq T(\vec{w})$ whenever $\vec{v} \neq \vec{w}$.
- T is called **surjective** or **onto** if every element of W is mapped to by an element of V . More precisely, for every $\vec{w} \in W$, there is some $v \in V$ with $T(\vec{v}) = \vec{w}$.

Activity. Let $T : \mathbb{R}^3 \rightarrow \mathbb{R}^2$ be given by the matrix $\begin{bmatrix} 1 & 0 \\ 0 & 1 \\ 0 & 0 \end{bmatrix}$. Determine if T is injective, surjective, both, or neither.

Activity. Let $T : \mathbb{R}^2 \rightarrow \mathbb{R}^3$ be given by the matrix $\begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \end{bmatrix}$. Determine if T is injective, surjective, both, or neither.

Definition. We also have two important sets called the **kernel** of T and the **image** of T .

$$\ker T = \{ \vec{v} \in V \mid T(\vec{v}) = 0 \}$$

$$\text{Im } T = \{ \vec{w} \in W \mid \text{there is some } v \in V \text{ with } T(\vec{v}) = \vec{w} \}$$

Activity. Let $T : \mathbb{R}^3 \rightarrow \mathbb{R}^2$ be given by the matrix $\begin{bmatrix} 1 & 0 \\ 0 & 1 \\ 0 & 0 \end{bmatrix}$ (for the standard basis). Find the kernel and image of T .

Activity. Let $T : \mathbb{R}^2 \rightarrow \mathbb{R}^3$ be given by the matrix $\begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \end{bmatrix}$ (for the standard basis). Find the kernel and image of T .

Activity. Part X: Describe surjective linear transformations in terms of the image.

Part X: Describe injective linear transformations in terms of the kernel.

Activity. Let $T : \mathbb{R}^3 \rightarrow \mathbb{R}^2$ be the linear transformation given by the matrix $A = \begin{bmatrix} 3 & 4 & -1 \\ 1 & 2 & 1 \end{bmatrix}$ (for the standard basis).

- 1) Write a system of equations whose solution set is the kernel.
- 2) Compute $\text{RREF}(A)$ and solve the system of equations.

- 3) Compute the kernel of T
 - 4) Find a basis for the kernel of T
-

Activity. Let $S : \mathbb{R}^3 \rightarrow \mathbb{R}^2$ be the linear transformation given by the matrix $B = \begin{bmatrix} 3 & 4 & 1 \\ 1 & 2 & 4 \\ 5 & 8 & 9 \end{bmatrix}$ (for the standard basis).

- 1) Write a system of equations whose solution set is the kernel.
 - 2) Compute $\text{RREF}(A)$ and solve the system of equations.
 - 3) Compute the kernel of T
 - 4) Find a basis for the kernel of T
-

Activity. Let $T : \mathbb{R}^3 \rightarrow \mathbb{R}^3$ be the linear transformation given by the matrix $A = \begin{bmatrix} 3 & 4 & -1 \\ 1 & 2 & 1 \end{bmatrix}$ (for the standard basis).

- 1) Find a set of vectors that span the image of T
 - 2) Find a basis for the image of T .
-

Activity. Let $S : \mathbb{R}^3 \rightarrow \mathbb{R}^3$ be the linear transformation given by the matrix $B = \begin{bmatrix} 3 & 4 & 1 \\ 1 & 2 & 4 \\ 5 & 8 & 9 \end{bmatrix}$ (for the standard basis).

- 1) Find a set of vectors that span the image of T
 - 2) Find a basis for the image of T .
-

Application Activities - Day 3

Activity. Let $T : \mathbb{R}^n \rightarrow \mathbb{R}^m$ be a linear map with matrix $A \in M_{m,n}$ (for the standard basis). You have cards containing a number of statements about T and A . Sort them into groups of equivalent statements, and post them on your board.

(Instructor Note:) Card sort activity for 10-15 minutes: cards contain the following

- (a) T is injective
- (b) T is not injective
- (c) T is surjective
- (d) T is not surjective
- (e) The system of linear equations given by the augmented matrix $\left[A \mid \vec{b} \right]$ has a solution for all $\vec{b} \in \mathbb{R}^m$
- (f) The system of linear equations given by the augmented matrix $\left[A \mid \vec{b} \right]$ has a unique solution for all $\vec{b} \in \mathbb{R}^m$
- (g) The system of linear equations given by the augmented matrix $\left[A \mid \vec{0} \right]$ has a non-trivial solution.
- (h) The columns of A span \mathbb{R}^m
- (i) The columns of A are linearly independent
- (j) The columns of A are a basis of \mathbb{R}^m
- (k) Every column of $\text{RREF}(A)$ is a pivot column
- (l) $\text{RREF}(A)$ has a non-pivot column
- (m) $\text{RREF}(A)$ has n pivot columns

Activity. **(Instructor Note:)** Gallery walk Cycle around the room counter-clockwise. If they have two things grouped together that you know are not equivalent, write a reason or counter-example on a sticky note.

Activity. Come up with as many statements as you can, and add them to the appropriate group.

Readiness Assurance Outcomes

Before beginning this module, each student should be able to...

- Compose functions of real numbers
- Solve systems of linear equations (**Standard(s) E.3**)
- Find the matrix corresponding to a linear transformation (**Standard(s) A.1**)
- Determine if a linear transformation is injective and/or surjective (**Standard(s) A.3**)
- Interpret the ideas of injectivity and surjectivity in multiple ways

Readiness Assurance Resources

The following resources will help you prepare for this module.

- <https://www.khanacademy.org/math/algebra2/manipulating-functions/function-composition/v/function-composition>

Readiness Assurance Test

Choose the most appropriate response for each question.

1) Let $f(x) = x^2 - 2$ and $g(x) = x^2 + 1$. Compute the composition function $(f \circ g)(x)$.

- (a) $x^2 - 1$
- (b) $x^4 + 2x^2 - 1$
- (c) $x^4 - 4x^2 + 5$
- (d) $x^4 - x^2 - 2$

2) Suppose $f(x)$ and $g(x)$ are real-valued functions satisfying

$$\begin{array}{ll} f(2) = 1 & g(2) = 3 \\ f(3) = 4 & g(3) = 5 \\ f(4) = 3 & g(4) = 6 \end{array}$$

Compute $(f \circ g)(2)$.

- (a) 2
- (b) 3
- (c) 4
- (d) 5

3) Solve the system of linear equations

$$\begin{array}{l} x + 3y = -2 \\ 2x - 7y = 9 \end{array}$$

- (a) $\begin{bmatrix} 1 \\ -1 \end{bmatrix}$
- (b) $\begin{bmatrix} 3 \\ 1 \end{bmatrix}$
- (c) $\begin{bmatrix} 2 \\ 3 \end{bmatrix}$
- (d) $\begin{bmatrix} -2 \\ 9 \end{bmatrix}$

4) Let a, b, c be fixed real numbers. How many solutions does the system of linear equations below have?

$$\begin{array}{l} x + 2y + 3z = a \\ y - z = b \\ y + z = c \end{array}$$

- (a) 0
- (b) 1
- (c) Infinitely many
- (d) It depends on the values of a , b , and c .

5) What is the matrix corresponding to the linear transformation $T : \mathbb{R}^3 \rightarrow \mathbb{R}^3$ given by $T \left(\begin{bmatrix} x \\ y \\ z \end{bmatrix} \right) =$

$$\begin{bmatrix} x + 2y - z \\ y + 3z \\ x + 7y \end{bmatrix} ?$$

(a) $\begin{bmatrix} 1 & 2 & -1 \\ 0 & 1 & 3 \\ 1 & 7 & 0 \end{bmatrix}$

(b) $\begin{bmatrix} 1 & 2 & -1 \\ 1 & 3 & 0 \\ 1 & 7 & 0 \end{bmatrix}$

(c) $\begin{bmatrix} 1 & 1 & 1 \\ 2 & 3 & 7 \\ -1 & 0 & 0 \end{bmatrix}$

(d) $\begin{bmatrix} 1 & 0 & 1 \\ 2 & 1 & 7 \\ -1 & 3 & 0 \end{bmatrix}$

6) Let $T : \mathbb{R}^2 \rightarrow \mathbb{R}^3$ be the linear transformation with associated matrix $A = \begin{bmatrix} 2 & 3 \\ -1 & -1 \\ 0 & 4 \end{bmatrix}$. Compute

$T\left(\begin{bmatrix} 2 \\ -1 \end{bmatrix}\right).$

(a) $\begin{bmatrix} 5 \\ 7 \\ 4 \end{bmatrix}$

(b) $\begin{bmatrix} 1 \\ -1 \\ -4 \end{bmatrix}$

(c) $\begin{bmatrix} 2 \\ -1 \\ 0 \end{bmatrix}$

(d) $\begin{bmatrix} 4 \\ -1 \\ 8 \end{bmatrix}$

7) Which of the following is true of the linear transformation $T : ?$

- (a) T is neither injective nor surjective
- (b) T is injective but not surjective
- (c) T is surjective but not injective
- (d) T is both injective and surjective

8) Which of the following is true of the linear transformation $T : ?$

- (a) T is neither injective nor surjective
- (b) T is injective but not surjective
- (c) T is surjective but not injective
- (d) T is both injective and surjective

9) Let $T : \mathbb{R}^n \rightarrow \mathbb{R}^m$ be a linear transformation with associated matrix $A \in M_{m,n}(\mathbb{R})$. Three of the four answer choices are equivalent to each other; which one is not equivalent to the other three?

- (a) T is injective
- (b) T has a non-trivial kernel
- (c) The columns of A are linearly dependent
- (d) $\text{RREF}(A)$ has a non-pivot column

10) Let $T : \mathbb{R}^n \rightarrow \mathbb{R}^m$ be a linear transformation with associated matrix $A \in M_{m,n}(\mathbb{R})$. Three of the four answer choices are equivalent to each other; which one is not equivalent to the other three?

- (a) T is surjective
- (b) $\text{Im } T = \mathbb{R}^m$
- (c) The columns of A span \mathbb{R}^m
- (d) $\text{RREF}(A)$ has only pivot columns

Application Activities - Day 1

Activity. Let $T : \mathbb{R}^3 \rightarrow \mathbb{R}^2$ be given by the matrix $B = \begin{bmatrix} 2 & 1 & -3 \\ 5 & -3 & 4 \end{bmatrix}$ and $S : \mathbb{R}^2 \rightarrow \mathbb{R}^4$ be given by the matrix $A = \begin{bmatrix} 1 & 2 \\ 0 & 1 \\ 3 & 5 \\ -1 & -2 \end{bmatrix}$.

What is the domain of the composition map $S \circ T$?

- (a) \mathbb{R}
 - (b) \mathbb{R}^2
 - (c) \mathbb{R}^3
 - (d) \mathbb{R}^4
-

Activity. What is the codomain of the composition map $S \circ T$?

- (a) \mathbb{R}
 - (b) \mathbb{R}^2
 - (c) \mathbb{R}^3
 - (d) \mathbb{R}^4
-

Activity. The matrix corresponding to $S \circ T$ will lie in which matrix space?

- (a) $M_{4,3}$
 - (b) $M_{4,2}$
 - (c) $M_{3,2}$
 - (d) $M_{2,3}$
 - (e) $M_{2,4}$
 - (f) $M_{3,4}$
-

Activity. Compute $(S \circ T)(\vec{e}_1)$, $(S \circ T)(\vec{e}_2)$, and $(S \circ T)(\vec{e}_3)$.

Activity. Find the matrix corresponding to $S \circ T$ with respect to the standard bases.

Activity. Let $T : \mathbb{R}^2 \rightarrow \mathbb{R}^3$ be given by the matrix $B = \begin{bmatrix} 2 & 3 \\ 1 & -1 \\ 0 & -1 \end{bmatrix}$ and $S : \mathbb{R}^3 \rightarrow \mathbb{R}^2$ be given by the matrix

$$A = \begin{bmatrix} -4 & -2 & 3 \\ 0 & 1 & 1 \end{bmatrix}.$$

What is the domain of the composition map $S \circ T$?

- (a) \mathbb{R}
 - (b) \mathbb{R}^2
 - (c) \mathbb{R}^3
 - (d) \mathbb{R}^4
-

Activity. What is the codomain of the composition map $S \circ T$?

- (a) \mathbb{R}
 - (b) \mathbb{R}^2
 - (c) \mathbb{R}^3
 - (d) \mathbb{R}^4
-

Activity. The matrix corresponding to $S \circ T$ will lie in which matrix space?

- (a) $M_{2,2}$
 - (b) $M_{2,3}$
 - (c) $M_{3,2}$
 - (d) $M_{3,3}$
-

Activity. Compute $(S \circ T)(\vec{e}_1)$ and $(S \circ T)(\vec{e}_2)$

Activity. Find the matrix corresponding to $S \circ T$ with respect to the standard bases.

Activity. Let $T : \mathbb{R}^1 \rightarrow \mathbb{R}^4$ be given by the matrix $B = \begin{bmatrix} 3 \\ -2 \\ 1 \\ -1 \end{bmatrix}$ and $S : \mathbb{R}^4 \rightarrow \mathbb{R}^1$ be given by the matrix

$$A = [2 \quad 3 \quad 2 \quad 5].$$

What is the domain of the composition map $S \circ T$?

- (a) \mathbb{R}
 - (b) \mathbb{R}^2
 - (c) \mathbb{R}^3
 - (d) \mathbb{R}^4
-

Activity. What is the codomain of the composition map $S \circ T$?

- (a) \mathbb{R}
 - (b) \mathbb{R}^2
 - (c) \mathbb{R}^3
 - (d) \mathbb{R}^4
-

Activity. The matrix corresponding to $S \circ T$ will lie in which matrix space?

- (a) $M_{1,1}$
 - (b) $M_{1,4}$
 - (c) $M_{4,1}$
 - (d) $M_{4,4}$
-

Activity. Compute $(S \circ T)(\vec{e}_1)$

Activity. Find the matrix corresponding to $S \circ T$ with respect to the standard bases.

Activity. Let $A = \begin{bmatrix} 3 & 1 & -1 \\ 2 & 0 & 4 \\ -1 & 3 & 5 \end{bmatrix}$ and $X = \begin{bmatrix} x \\ y \\ z \end{bmatrix}$

1. Compute AX
2. Interpret the system of equations below as a matrix equation

$$\begin{aligned} 3x + y - z &= 5 \\ 2x + 4z &= -7 \\ -x + 3y + 5z &= 2 \end{aligned}$$

Application Activities - Day 2

Activity. Each row operation can be interpreted as a matrix multiplication. Let $A \in M_{4,4}$

- 1) Find a matrix S_1 such that S_1A is the result of swapping the second and fourth rows of A .
 - 2) Find a matrix S_2 such that S_2A is the result of adding 5 times the third row of A to the first.
 - 3) Find a matrix S_3 such that S_3A is the result of doubling the fourth row of A .
-

Activity. Let $T : \mathbb{R}^n \rightarrow \mathbb{R}^m$ be a linear map with matrix $A \in M_{m,n}$ (for the standard basis). Consider the following statements about T

- (a) T is injective
- (b) T is surjective
- (c) T is bijective (i.e. both injective and surjective)
- (d) $AX = B$ has a solution for all $B \in M_{m,1}$
- (e) $AX = B$ has a unique solution for all $B \in M_{m,1}$
- (f) $AX = 0$ has a non-trivial solution.
- (g) The columns of A span \mathbb{R}^m
- (h) The columns of A are linearly independent
- (i) The columns of A are a basis of \mathbb{R}^m
- (j) $\text{RREF}(A)$ has n pivot columns
- (k) $\text{RREF}(A)$ has m pivot columns

Sort these statements into groups of equivalent statements.

Activity. Let $T : \mathbb{R}^n \rightarrow \mathbb{R}^m$ be a linear map with matrix $A \in M_{m,n}$ (for the standard basis). If T is injective, what must be true about how m and n are related?

- (a) $m < n$
 - (b) $m \leq n$
 - (c) $m = n$
 - (d) $m \geq n$
 - (e) $m > n$
-

Activity. If T is surjective, what must be true about how m and n are related?

- (a) $m < n$
 - (b) $m \leq n$
 - (c) $m = n$
 - (d) $m \geq n$
 - (e) $m > n$
-

Activity. If T is bijective, what must be true about how m and n are related?

- (a) $m < n$
 - (b) $m \leq n$
 - (c) $m = n$
 - (d) $m \geq n$
 - (e) $m > n$
-

Application Activities - Day 3

Activity. Let $T : \mathbb{R}^n \rightarrow \mathbb{R}^n$ be a linear map with matrix $A \in M_{n,n}$.

If T is a bijection, then $AX = B$ has a unique solution for all $B \in \mathbb{R}^n$. Thus we can define a map $T^{-1} : \mathbb{R}^n \rightarrow \mathbb{R}^n$ by defining $T^{-1}(B)$ to be this solution. It follows immediately that $T \circ T^{-1}$ is the identity map. The matrix corresponding to T^{-1} is denoted A^{-1} .

- 1) Solve $AX = \vec{e}_1$ to determine $T^{-1}(\vec{e}_1)$
- 2) Solve $AX = \vec{e}_2$ to determine $T^{-1}(\vec{e}_2)$
- 3) Solve $AX = \vec{e}_3$ to determine $T^{-1}(\vec{e}_3)$
- 4) Compute A^{-1}

A (square) matrix is called *invertible* if it corresponds to an invertible linear transformation.

- 1) Find the inverse of the matrix $\begin{bmatrix} 1 & 3 \\ 0 & -2 \end{bmatrix}$
 - 2) Find the inverse of the matrix $\begin{bmatrix} 1 & -2 & 1 \\ -3 & 7 & 6 \\ 2 & -3 & 0 \end{bmatrix}$
-

Readiness Assurance Outcomes

Before beginning this module, each student should be able to...

- Calculate the area of a parallelogram.
- Find the matrix corresponding to a linear transformation of Euclidean spaces (**Standard(s) A1**).
- Recall and use the definition of a linear transformation (**Standard(s) A2**).
- Find all roots of quadratic polynomials (including complex ones), and be able to use the rational root theorem to find all rational roots of a higher degree polynomial.
- Interpret the statement “ A is an invertible matrix” in many equivalent ways in different contexts.

Readiness Assurance Resources

The following resources will help you prepare for this module.

- Finding the area of a parallelogram: <https://www.khanacademy.org/math/basic-geo/basic-geo-area-and-perimeter/parallelogram-area/a/area-of-parallelogram>
- Factoring quadratics: <https://www.khanacademy.org/math/algebra2/polynomial-functions/factoring-polynomials/v/factoring-polynomials-1>
- Finding complex roots of quadratics: <https://www.khanacademy.org/math/algebra2/polynomial-functions/quadratic-equations-with-complex-numbers/v/complex-roots-from-the-quadratic-formula>
- Finding all roots of polynomials: <https://www.khanacademy.org/math/algebra2/polynomial-functions/finding-zeros-of-polynomials/v/finding-roots-or-zeros-of-polynomial-1>
- The Rational Root Theorem: https://artofproblemsolving.com/wiki/index.php?title=Rational_Root_Theorem

Readiness Assurance Test

Choose the most appropriate response for each question.

- 1) Find the area of the parallelogram with vertices $(0, 0)$, $(4, 0)$, $(5, 2)$, and $(1, 2)$.

- (a) 5
- (b) 6
- (c) 7
- (d) 8

- 2) Find the area of the parallelogram with vertices $(0, 0)$, $(12, 5)$, $(14, 8)$, and $(2, 3)$.

- (a) 13
- (b) 26
- (c) 39
- (d) 52

- 3) The parallelogram ABCD has area 6. If AE is $\frac{3}{2}$ the length of AB, what is the area of the parallelogram AEFD?

- (a) 9
- (b) 12
- (c) 15
- (d) 18

- 4) The parallelogram ABCD has area 6. If AF is one third as long as AD, what is the area of the parallelogram ABEF?

- (a) 1
- (b) 2
- (c) 3
- (d) 4

- 5) Let $T : \mathbb{R}^2 \rightarrow \mathbb{R}$ be a linear transformation. Which of the following is equal to $T \left(\begin{bmatrix} a+b \\ a+b \end{bmatrix} \right)$?
- (a) $T \left(\begin{bmatrix} a \\ b \end{bmatrix} \right)$ (c) $T \left(\begin{bmatrix} a \\ b \end{bmatrix} \right) + T \left(\begin{bmatrix} b \\ a \end{bmatrix} \right)$
 (b) $2T \left(\begin{bmatrix} a \\ b \end{bmatrix} \right)$ (d) $T \left(\begin{bmatrix} a \\ a \end{bmatrix} \right) + T \left(\begin{bmatrix} a \\ b \end{bmatrix} \right) + T \left(\begin{bmatrix} b \\ a \end{bmatrix} \right) + T \left(\begin{bmatrix} b \\ b \end{bmatrix} \right)$
- 6) Let $T : \mathbb{R}^n \rightarrow \mathbb{R}^n$ be a linear transformation with associated matrix $A \in M_n(\mathbb{R})$. Three of the four answer choices are equivalent to each other; which one is not equivalent to the other three?
- (a) A is not an invertible matrix
 (b) T has a non-trivial kernel
 (c) $\det(A) \neq 0$
 (d) $A\vec{x} = \vec{b}$ has multiple solutions for all $\vec{b} \in \mathbb{R}^n$.
- 7) What is the matrix corresponding to the linear transformation $T : \mathbb{R}^3 \rightarrow \mathbb{R}^3$ given by $T \left(\begin{bmatrix} x \\ y \\ z \end{bmatrix} \right) = \begin{bmatrix} 3x + 2y - z \\ y + z \\ x + 7z \end{bmatrix}$?
- (a) $\begin{bmatrix} 3 & 2 & -1 \\ 0 & 1 & 1 \\ 1 & 0 & 7 \end{bmatrix}$ (b) $\begin{bmatrix} 3 & 0 & 1 \\ 2 & 1 & 0 \\ -1 & 1 & 7 \end{bmatrix}$ (c) $\begin{bmatrix} 3 & 2 & -1 \\ 1 & 1 & 0 \\ 1 & 7 & 0 \end{bmatrix}$ (d) $\begin{bmatrix} 3 & 1 & 1 \\ 2 & 1 & 7 \\ -1 & 0 & 0 \end{bmatrix}$
- 8) Which of the following conditions imply that the quadratic polynomial $ax^2 + bx + c$ has no real roots?
- (a) $a < 0$
 (b) $b^2 - 4ac < 0$
 (c) $ac - b^2 < 0$
 (d) $ab + c^2 < 0$
- 9) Which of the following is a root of the polynomial $x^2 - 4x + 13$?

(a) $1 + 2i$

(b) $2 - 3i$

(c) $3 + 4i$

(d) $4 - 5i$

10) How many roots does the polynomial $x^4 + 3x^3 + x^2 - 3x - 2$ have?

(a) 1

(b) 2

(c) 3

(d) 4

Application Activities - Days 1-2

Activity. Consider the linear transformation $A : \mathbb{R}^2 \rightarrow \mathbb{R}^2$ given by the matrix $A = \begin{bmatrix} 2 & 0 \\ 0 & 3 \end{bmatrix}$

We can summarize the transformation of the unit square into this rectangle by measuring the following:

- How did the area change?
- How was the x -axis stretched?
- How was the y -axis stretched?

Activity. Consider the following linear transformations $A_i : \mathbb{R}^2 \rightarrow \mathbb{R}^2$.

- $A_2 = \begin{bmatrix} 2 & 3 \\ 0 & 1 \end{bmatrix}$
- $A_3 = \begin{bmatrix} 1 & -1 \\ 1 & 1 \end{bmatrix}$
- $A_4 = \begin{bmatrix} 0 & 1 \\ 1 & 0 \end{bmatrix}$
- $A_5 = \begin{bmatrix} 1 & 1 \\ 0 & 0 \end{bmatrix}$

For each linear transformation, do the following:

- Draw a graph showing the image of the unit square.

- (b) Compute how much the area was stretched out.
- (c) Determine which axes (or lines) were preserved; how were they stretched out?
-

Activity. Our goal is to define a function $\det : M_n \rightarrow \mathbb{R}$ that takes a square matrix (linear transformation $\mathbb{R}^n \rightarrow \mathbb{R}^n$) and returns its area stretching factor. This function is called the **determinant**.

What properties should this function have?

Match the four pictures to the following four expressions

Activity. What can you conclude about each of the following?

1. $\det(\vec{e}_1, \vec{e}_2)$
 2. $\det(\vec{v}, \vec{v})$
 3. $\det(c\vec{v}, \vec{w})$
 4. $\det(\vec{u} + \vec{v}, \vec{w})$
-

Definition. To summarize, we have 3 properties (stated here over \mathbb{R}^n)

P1: $\det(\vec{e}_1, \vec{e}_2, \dots, \vec{e}_n) = 1$

P2: If $\vec{v}_i = \vec{v}_j$ for some $i \neq j$, then $\det(\vec{v}_1, \vec{v}_2, \dots, \vec{v}_n) = 0$.

P3: The determinant is linear in each column.

These three properties uniquely define the **determinant**, as we shall see.

Observation. Note that if $\vec{v}, \vec{w} \in \mathbb{R}^2$ and $A = [\vec{v} \ \vec{w}]$ we will write either $\det(A)$ or $\det(\vec{v}, \vec{w})$ as is convenient.

Activity.

How are $\det(\vec{v}, \vec{w})$ and $\det(\vec{w}, \vec{v})$ related?

- (a) $\det(\vec{v}, \vec{w}) = \det(\vec{w}, \vec{v})$
 - (b) $\det(\vec{v}, \vec{w}) = -\det(\vec{w}, \vec{v})$
 - (c) They are unrelated
 - (d) They are related, but not by either (a) or (b).
-

Observation. Note that this implies that the determinant is actually a *signed* area (volume)!

Activity.

How are $\det(\vec{v} + \vec{w}, \vec{w})$ and $\det(\vec{v}, \vec{w})$ related?

- (a) $\det(\vec{v} + \vec{w}, \vec{w}) = \det(\vec{v}, \vec{w})$
 - (b) $\det(\vec{v} + \vec{w}, \vec{w}) = -\det(\vec{v}, \vec{w})$
 - (c) They are unrelated
 - (d) They are related, but not by either (a) or (b).
-

Observation. Note that we now understand the effect of any column operation on the determinant.

Activity. How are $\det(A)$ and $\det(A^T)$ related?

- (a) $\det(A) = \det(A^T)$
 - (b) $\det(A) = -\det(A^T)$
 - (c) $\det(A) = \frac{1}{\det(A^T)}$
 - (d) They are unrelated
-

Observation. Thus, row operations behave like column operations. So we can use row reduction to compute determinants.

Activity. Compute $\det \begin{bmatrix} 4 & 5 \\ 2 & 3 \end{bmatrix}$.

Activity. Compute $\det \begin{bmatrix} a & b \\ c & d \end{bmatrix}$

Activity. Which of the following is the same as $\det \begin{bmatrix} 3 & -2 & 0 \\ 5 & -1 & 0 \\ -2 & 4 & 1 \end{bmatrix}$?

- (a) $\det \begin{bmatrix} 3 & -2 \\ 5 & -1 \end{bmatrix}$
 - (b) $\det \begin{bmatrix} 3 & -2 \\ -2 & 4 \end{bmatrix}$
 - (c) $\det \begin{bmatrix} 5 & -1 \\ -2 & 4 \end{bmatrix}$
 - (d) None of these
-

Activity. Which of the following is the same as $\det \begin{bmatrix} 3 & 0 & 7 \\ 5 & 1 & 2 \\ -2 & 0 & 6 \end{bmatrix}$?

- (a) $\det \begin{bmatrix} 3 & 7 \\ 5 & 2 \end{bmatrix}$
 - (b) $\det \begin{bmatrix} 3 & 7 \\ -2 & 6 \end{bmatrix}$
 - (c) $\det \begin{bmatrix} 5 & 2 \\ -2 & 6 \end{bmatrix}$
 - (d) None of these
-

Activity. Compute $\det \begin{bmatrix} 0 & 3 & -2 \\ 1 & 5 & 12 \\ 0 & 2 & -1 \end{bmatrix}$

Activity. Using the fact that $\begin{bmatrix} 1 \\ 1 \\ 0 \end{bmatrix} = \begin{bmatrix} 1 \\ 0 \\ 0 \end{bmatrix} + \begin{bmatrix} 0 \\ 1 \\ 0 \end{bmatrix}$, compute $\det \begin{bmatrix} 1 & 2 & 3 \\ 1 & -2 & 5 \\ 0 & 3 & 3 \end{bmatrix}$.

Activity. Compute $\begin{bmatrix} 2 & 3 & 5 & 0 \\ 0 & 1 & -1 & 0 \\ 1 & 2 & 0 & 3 \\ -1 & -1 & 2 & 2 \end{bmatrix}$

Application Activities - Day 3

Activity. Consider the linear transformation $A : \mathbb{R}^2 \rightarrow \mathbb{R}^2$ given by the matrix $A = \begin{bmatrix} 2 & 2 \\ 0 & 3 \end{bmatrix}$

Observe

$$A\vec{e}_1 = A \begin{bmatrix} 1 \\ 0 \end{bmatrix} = 2 \begin{bmatrix} 1 \\ 0 \end{bmatrix} = 2\vec{e}_1$$

Is there another vector $\vec{v} \in \mathbb{R}^2$ such that $A\vec{v} = \lambda\vec{v}$ for some $\lambda \in \mathbb{R}$?

Definition. Let $A \in M_n(\mathbb{R})$. An **eigenvector** is a vector $\vec{x} \in \mathbb{R}^n$ such that $A\vec{x}$ is parallel to \vec{x} ; in other words, $A\vec{x} = \lambda\vec{x}$ for some scalar λ , which is called an **eigenvalue**

Observation. Observe that $A\vec{x} = \lambda\vec{x}$ is equivalent to $(A - \lambda I)\vec{x} = 0$.

- To find eigenvalues, we need to find values of λ such that $A - \lambda I$ has a nontrivial kernel; equivalently, $A - \lambda I$ is not invertible, which is equivalent to $\det(A - \lambda I) = 0$. $\det(A - \lambda I)$ is called the **characteristic polynomial**.
- Once an eigenvalue is found, the eigenvectors form a subspace called the **eigenspace**, which is simply the kernel of $A - \lambda I$. Each eigenvalue will have an associated eigenspace.

Activity. Find the eigenvalues for the matrix $A = \begin{bmatrix} 2 & 2 \\ 0 & 3 \end{bmatrix}$.

Activity. Compute the eigenspace associated to the eigenvalue 3.

Activity. Find all the eigenvalues and associated eigenspaces for the matrix $\begin{bmatrix} 6 & -2 & 1 \\ 17 & -5 & 5 \\ -4 & 2 & 1 \end{bmatrix}$.

Application Activities - Day 4

Activity. If $A \in M_4$, what is the largest number of eigenvalues A can have?

Activity. 2 is an eigenvalue of each of the matrices $A = \begin{bmatrix} 1 & -2 & 1 \\ -1 & 0 & 1 \\ -1 & -2 & 3 \end{bmatrix}$ and $B = \begin{bmatrix} -3 & -9 & 5 \\ -2 & -2 & 2 \\ -7 & -13 & 9 \end{bmatrix}$.
Compute the eigenspace associated to 2 for both A and B .

Definition. • The **algebraic multiplicity** of an eigenvalue is its multiplicity as a root of the characteristic polynomial.

• The **geometric multiplicity** of an eigenvalue is the dimension of the eigenspace.

Activity. How are the algebraic and geometric multiplicities related?

- (a) The algebraic multiplicity is always at least as big as than the geometric multiplicity.
 - (b) The geometric multiplicity is always at least as big as the algebraic multiplicity.
 - (c) Sometimes the algebraic multiplicity is larger and sometimes the geometric multiplicity is larger.
-

Activity. Find the eigenvalues, along with both their algebraic and geometric multiplicities, for the matrix $\begin{bmatrix} -3 & 1 & 2 & 1 \\ -9 & 5 & -2 & -1 \\ 31 & -17 & 6 & 3 \\ -69 & 39 & -18 & -9 \end{bmatrix}$

Activity. Find the eigenvalues of the matrix $A = \begin{bmatrix} 0 & -1 \\ 1 & 0 \end{bmatrix}$

Activity. Describe what this linear transformation is doing geometrically; draw a picture.

Activity. Fix a real number θ and find the eigenvalues of the matrix $A_\theta = \begin{bmatrix} \cos(\theta) & -\sin(\theta) \\ \sin(\theta) & \cos(\theta) \end{bmatrix}$. What are the eigenvalues?

Activity. Draw pictures and describe the geometric actions of the maps $A_{\frac{\pi}{4}}$, $A_{\frac{\pi}{2}}$, and A_π .

Activity. For how many values of θ does the rotation matrix A_θ have real eigenvalues?

- (a) 0
 - (b) 1
 - (c) 2
 - (d) 3
 - (e) An infinite number
-
