

## Application Activities - Module G Part 2 - Class Day 26

**Definition 26.1** The **transpose** of a matrix is given by rewriting its columns as rows and vice versa:

$$\begin{bmatrix} 1 & 2 & 3 \\ 4 & 5 & 6 \end{bmatrix}^T = \begin{bmatrix} 1 & 4 \\ 2 & 5 \\ 3 & 6 \end{bmatrix}$$

**Fact 26.2** It is possible to prove that the determinant of a matrix and its transpose are the same. For example, let  $A = \begin{bmatrix} 3 & 3 \\ 0 & 2 \end{bmatrix}$ , so  $A^T = \begin{bmatrix} 3 & 0 \\ 3 & 2 \end{bmatrix}$ ; both matrices scale the unit square by 6, even though the parallelograms are not congruent.

**Fact 26.3** We previously figured out that column operations can be used to simplify determinants; since  $\det(A) = \det(A^T)$ , we can also use row operations:

1. Multiplying rows by scalars:  $\det \begin{bmatrix} \vdots \\ cR \\ \vdots \end{bmatrix} = c \det \begin{bmatrix} \vdots \\ R \\ \vdots \end{bmatrix}$

2. Swapping two rows:  $\det \begin{bmatrix} \vdots \\ R \\ \vdots \\ S \\ \vdots \end{bmatrix} = -\det \begin{bmatrix} \vdots \\ S \\ \vdots \\ R \\ \vdots \end{bmatrix}$

3. Adding multiples of rows to other rows:  $\det \begin{bmatrix} \vdots \\ R \\ \vdots \\ S \\ \vdots \end{bmatrix} = \det \begin{bmatrix} \vdots \\ R \\ \vdots \\ R + cS \\ \vdots \end{bmatrix}$

**Activity 26.4** Compute the determinant of  $\begin{bmatrix} 2 & 4 \\ 2 & 3 \end{bmatrix}$  by row reducing it to a nicer matrix.

For example,  $\det \begin{bmatrix} 2 & 4 \\ 2 & 3 \end{bmatrix} = 2 \det \begin{bmatrix} 1 & 2 \\ 2 & 3 \end{bmatrix}$ .

---

**Fact 26.5** This same process allows us to prove a more convenient formula:

$$\det \begin{bmatrix} a & b \\ c & d \end{bmatrix} = ad - bc$$

In higher dimensions, the formulas become unreasonable. For example, the formula for  $4 \times 4$  matrices has 24 terms!

**Activity 26.6** The following image illustrates the transformation of the unit cube by the matrix  $\begin{bmatrix} 3 & 1 & 0 \\ 1 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}$ .

This volume is equal to which of the following areas?

- (a)  $\det \begin{bmatrix} 3 & 1 \\ 1 & 1 \end{bmatrix}$       (b)  $\det \begin{bmatrix} 3 & 1 \\ 1 & 0 \end{bmatrix}$       (c)  $\det \begin{bmatrix} 3 & 1 \\ 0 & 1 \end{bmatrix}$       (d)  $\det \begin{bmatrix} 1 & 1 \\ 0 & 1 \end{bmatrix}$
- 

**Fact 26.7** If column  $i$  of a matrix is  $\mathbf{e}_i$ , then both column and row  $i$  may be removed without changing the value of the determinant. For example, the second column of the following matrix is  $\mathbf{e}_2$ , so:

$$\det \begin{bmatrix} 3 & 0 & -1 & 5 \\ 2 & 1 & 4 & 0 \\ -1 & 0 & 1 & 11 \\ 3 & 0 & 0 & 1 \end{bmatrix} = \det \begin{bmatrix} 3 & -1 & 5 \\ -1 & 1 & 11 \\ 3 & 0 & 1 \end{bmatrix}$$

Therefore the same holds for the transpose:

$$\det \begin{bmatrix} 3 & 2 & -1 & 3 \\ 0 & 1 & 0 & 0 \\ -1 & 4 & 1 & 0 \\ 5 & 0 & 11 & 1 \end{bmatrix} = \det \begin{bmatrix} 3 & -1 & 3 \\ -1 & 1 & 0 \\ 5 & 11 & 1 \end{bmatrix}$$

Geometrically, this is the fact that if the height is 1, the base  $\times$  height formula reduces to the area/volume/etc. of the  $n - 1$  dimensional base.

---

**Activity 26.8** Compute  $\det \begin{bmatrix} 1 & 0 & 0 \\ 1 & 5 & 12 \\ 3 & 2 & -1 \end{bmatrix}$ .

---

**Activity 26.9** Compute  $\det \begin{bmatrix} 0 & 3 & -2 \\ 1 & 5 & 12 \\ 0 & 2 & -1 \end{bmatrix}$ .

(a)  $-1$

(b)  $0$

(c)  $1$

---

**Activity 26.10** Compute  $\det \begin{bmatrix} 1 & 2 & 3 \\ 1 & -2 & -5 \\ 0 & 3 & 3 \end{bmatrix}$

*Hint:*  $\begin{bmatrix} 1 \\ 1 \\ 0 \end{bmatrix} = \begin{bmatrix} 1 \\ 0 \\ 0 \end{bmatrix} + \begin{bmatrix} 0 \\ 1 \\ 0 \end{bmatrix}$ .

(a)  $3$

(b)  $6$

(c)  $9$

(d)  $12$

---

**Activity 26.11** Compute  $\det \begin{bmatrix} 2 & 3 & 5 & 0 \\ 0 & 3 & 2 & 0 \\ 1 & 2 & 0 & 3 \\ -1 & -1 & 2 & 2 \end{bmatrix}$ .

---

**Observation 26.12**

$$\begin{aligned} \det \begin{bmatrix} 2 & 3 & 5 & 0 \\ 0 & 3 & 2 & 0 \\ 1 & 2 & 0 & 3 \\ -1 & -1 & 2 & 2 \end{bmatrix} &= (-1)(0) \det \begin{bmatrix} 2 & 3 & 5 & 0 \\ 0 & 3 & 2 & 0 \\ 1 & 2 & 0 & 3 \\ -1 & -1 & 2 & 2 \end{bmatrix} + (1)(3) \det \begin{bmatrix} 2 & 3 & 5 & 0 \\ 0 & 3 & 2 & 0 \\ 1 & 2 & 0 & 3 \\ -1 & -1 & 2 & 2 \end{bmatrix} + \\ &\quad (-1)(2) \det \begin{bmatrix} 2 & 3 & 5 & 0 \\ 0 & 3 & 2 & 0 \\ 1 & 2 & 0 & 3 \\ -1 & -1 & 2 & 2 \end{bmatrix} + (1)(0) \det \begin{bmatrix} 2 & 3 & 5 & 0 \\ 0 & 3 & 2 & 0 \\ 1 & 2 & 0 & 3 \\ -1 & -1 & 2 & 2 \end{bmatrix} \\ &= 3 \det \begin{bmatrix} 2 & 5 & 0 \\ 1 & 0 & 3 \\ -1 & 2 & 2 \end{bmatrix} + (-1)(2) \det \begin{bmatrix} 2 & 3 & 0 \\ 1 & 2 & 3 \\ -1 & -1 & 2 \end{bmatrix} \end{aligned}$$

This technique is called **Laplace expansion** or **cofactor expansion**.

**Activity 26.13** Compute  $\det \begin{bmatrix} 1 & 2 & 1 & 0 \\ 0 & 3 & 2 & -1 \\ 1 & 2 & 0 & 3 \\ -1 & -3 & 2 & -2 \end{bmatrix}$ .

---
