Definition 3.1 A linear equation is an equation of the variables x_i of the form

$$a_1x_1 + a_2x_2 + \dots + a_nx_n = b.$$

A solution for a linear equation is expressed in terms of the Euclidean vectors

$$\begin{bmatrix} x_1 \\ x_2 \\ \vdots \\ x_n \end{bmatrix} = \begin{bmatrix} s_1 \\ s_2 \\ \vdots \\ s_n \end{bmatrix}$$

and must satisfy

$$a_1s_1 + a_2s_2 + \dots + a_ns_n = b.$$

Definition 3.4 A system of linear equations (or a linear system for short) is a collection of one or more linear equations.

$$a_{11}x_1 + a_{12}x_2 + \ldots + a_{1n}x_n = b_1$$

$$a_{21}x_1 + a_{22}x_2 + \ldots + a_{2n}x_n = b_2$$

$$\vdots \qquad \vdots \qquad \vdots$$

$$a_{m1}x_1 + a_{m2}x_2 + \ldots + a_{mn}x_n = b_m$$

A solution

$$\begin{bmatrix} x_1 \\ x_2 \\ \vdots \\ x_n \end{bmatrix} = \begin{bmatrix} s_1 \\ s_2 \\ \vdots \\ s_n \end{bmatrix}$$

for a linear system satisfies

$$a_{i1}s_1 + a_{i2}s_2 + \dots + a_{in}s_n = b_i$$

for $1 \le i \le m$ (that is, the solution satisfies all equations in the system).

Definition 3.6 A linear system is **consistent** if there exists a solution for the system. Otherwise it is **inconsistent**.

Definition 3.14 A system of m linear equations with n variables is often represented by writing its coefficients and constants in an **augmented matrix**.

Definition 3.15 Two systems of linear equations (and their corresponding augmented matrices) are said to be **equivalent** if they have the same solution set.

For example, both of these systems have a single solution: $(x_1, x_2) = (1, 1)$.

$$3x_1 - 2x_2 = 1$$
$$x_1 + 4x_2 = 5$$

$$3x_1 - 2x_2 = 1$$
$$4x_1 + 2x_2 = 6$$

Therefore these augmented matrices are equivalent:

$$\begin{bmatrix} 3 & -2 & 1 \\ 1 & 4 & 5 \end{bmatrix}$$

$$\begin{bmatrix} 3 & -2 & 1 \\ 4 & 2 & 6 \end{bmatrix}$$
