Readiness Assurance Outcomes

Before beginning this module, each student should be able to...

- State the definition of a spanning set, and determine if a set of Euclidean vectors spans \mathbb{R}^n **V3**.
- State the definition of linear independence, and determine if a set of Euclidean vectors is linearly dependent or independent **V5**.
- State the definition of a basis, and determine if a set of Euclidean vectors is a basis V6,V7.
- Find a basis of the solution space to a homogeneous system of linear equations V10.

Section : Section : Section :

Definition A.1

A linear transformation (also known as a linear map) is a map between vector spaces that preserves the vector space operations. More precisely, if V and W are vector spaces, a map $T:V\to W$ is called a linear transformation if

- 1. $T(\vec{v} + \vec{w}) = T(\vec{v}) + T(\vec{w})$ for any $\vec{v}, \vec{w} \in V$.
- 2. $T(c\vec{v}) = cT(\vec{v})$ for any $c \in \mathbb{R}, \vec{v} \in V$.

In other words, a map is linear when vector space operations can be applied before or after the transformation without affecting the result.

Clontz & Lewis

Module A

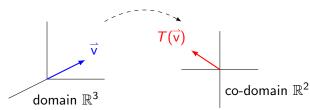

Section 1 Section 2 Section 3

Section Section Section

Definition A.2

Given a linear transformation $T: V \to W$, V is called the **domain** of T and W is called the **co-domain** of T.

Linear transformation $T: \mathbb{R}^3 \to \mathbb{R}^2$

Lewis

Example A.3

Let $T: \mathbb{R}^3 \to \mathbb{R}^2$ be given by

$$T\left(\begin{bmatrix} x \\ y \\ z \end{bmatrix}\right) = \begin{bmatrix} x - z \\ 3y \end{bmatrix}$$

To show that T is linear, we must verify...

$$\left(\begin{bmatrix} x \end{bmatrix} \quad \begin{bmatrix} u \end{bmatrix} \right) \quad \left(\begin{bmatrix} x + y \end{bmatrix} \right)$$

$$T\left(\begin{bmatrix} x \\ y \\ z \end{bmatrix} + \begin{bmatrix} u \\ v \\ w \end{bmatrix}\right) = T\left(\begin{bmatrix} x+u \\ y+v \\ z+w \end{bmatrix}\right) = \begin{bmatrix} (x+u)-(z+w) \\ 3(y+v) \end{bmatrix}$$

$$T\left(\begin{bmatrix} x \\ y \\ z \end{bmatrix}\right) + T\left(\begin{bmatrix} u \\ v \\ w \end{bmatrix}\right) = \begin{bmatrix} x-z \\ 3y \end{bmatrix} + \begin{bmatrix} u-w \\ 3v \end{bmatrix} = \begin{bmatrix} (x+u)-(z+w) \\ 3(y+v) \end{bmatrix}$$

And also...
$$T\left(c\begin{bmatrix}x\\y\\z\end{bmatrix}\right) = T\left(\begin{bmatrix}cx\\cy\\cz\end{bmatrix}\right) = \begin{bmatrix}cx - cz\\3cy\end{bmatrix} \text{ and } cT\left(\begin{bmatrix}x\\y\\z\end{bmatrix}\right) = c\begin{bmatrix}x - z\\3y\end{bmatrix} = \begin{bmatrix}cx - cz\\3cy\end{bmatrix}$$

Therefore
$$T$$
 is a linear transformation.

Section 1

$$T\left(\begin{bmatrix} x \\ y \end{bmatrix}\right) = \begin{bmatrix} x+y \\ x^2 \\ y+3 \\ y-2^x \end{bmatrix}$$

To show that T is not linear, we only need to find one counterexample.

$$T\left(\begin{bmatrix}0\\1\end{bmatrix} + \begin{bmatrix}2\\3\end{bmatrix}\right) = T\left(\begin{bmatrix}2\\4\end{bmatrix}\right) = \begin{bmatrix}6\\4\\7\\0\end{bmatrix}$$

$$T\left(\begin{bmatrix}0\\1\end{bmatrix}\right)+T\left(\begin{bmatrix}2\\3\end{bmatrix}\right)=\begin{bmatrix}1\\0\\4\\-1\end{bmatrix}+\begin{bmatrix}5\\4\\6\\-5\end{bmatrix}=\begin{bmatrix}6\\4\\10\\-6\end{bmatrix}$$

Since the resulting vectors are different, *T* is not a linear transformation.

Fact A.5

A map between Euclidean spaces $T: \mathbb{R}^n \to \mathbb{R}^m$ is linear exactly when every component of the output is a linear combination of the variables of \mathbb{R}^n .

For example, the following map is definitely linear because x-z and 3y are linear combinations of x,y,z:

$$T\left(\begin{bmatrix} x \\ y \\ z \end{bmatrix}\right) = \begin{bmatrix} x - z \\ 3y \end{bmatrix} = \begin{bmatrix} 1x + 0y - 1z \\ 0x + 3y + 0z \end{bmatrix}$$

But this map is not linear because x^2 , y+3, and $y-2^x$ are not linear combinations (even though x+y is):

$$T\left(\begin{bmatrix} x \\ y \end{bmatrix}\right) = \begin{bmatrix} x+y \\ x^2 \\ y+3 \\ y-2^x \end{bmatrix}$$

Activity A.6 (\sim 5 min) Recall the following rules from calculus, where $D: \mathcal{P} \to \mathcal{P}$ is the derivative map defined by D(f(x)) = f'(x) for each polynomial f.

$$D(f+g) = f'(x) + g'(x)$$

$$D(cf(x)) = cf'(x)$$

What can we conclude from these rules?

- a) \mathcal{P} is not a vector space
- b) D is a linear map
- c) D is not a linear map

Activity A.7 (\sim 10 min) Let the polynomial maps $S: \mathcal{P}^4 \to \mathcal{P}^3$ and $T: \mathcal{P}^4 \to \mathcal{P}^3$ be defined by

$$S(f(x)) = 2f'(x) - f''(x)$$
 $T(f(x)) = f'(x) + x^3$

Compute $S(x^4 + x)$, $S(x^4) + S(x)$, $T(x^4 + x)$, and $T(x^4) + T(x)$. Which of these maps is definitely not linear?

Module A

Section 2 Section 3 Section 4

Fact A.8

If $L: V \to W$ is linear, then $L(\vec{z}) = L(0\vec{v}) = 0L(\vec{v}) = \vec{z}$ where \vec{z} is the additive identity of the vector spaces V, W.

Put another way, an easy way to prove that a map like $T(f(x)) = f'(x) + x^3$ can't be linear is because

$$T(0) = \frac{d}{dx}[0] + x^3 = 0 + x^3 = x^3 \neq 0.$$

Observation A.9

Showing $L: V \to W$ is not a linear transformation can be done by finding an example for any one of the following.

- Show $L(\vec{z}) \neq \vec{z}$ (where \vec{z} is the additive identity of L and W).
- Find $\vec{v}, \vec{w} \in V$ such that $L(\vec{v} + \vec{w}) \neq L(\vec{v}) + L(\vec{w})$.
- Find $\vec{\mathsf{v}} \in V$ and $c \in \mathbb{R}$ such that $L(c\vec{\mathsf{v}}) \neq cL(\vec{\mathsf{v}})$.

Otherwise, L can be shown to be linear by proving the following in general.

- For all $\vec{v}, \vec{w} \in V$, $L(\vec{v} + \vec{w}) = L(\vec{v}) + L(\vec{w})$.
- For all $\vec{v} \in V$ and $c \in \mathbb{R}$, $L(c\vec{v}) = cL(\vec{v})$.

Note the similarities between this process and showing that a subset of a vector space is/isn't a subspace.

Remark A.12

Recall that a linear map $T: V \to W$ satisfies

1.
$$T(\vec{v} + \vec{w}) = T(\vec{v}) + T(\vec{w})$$
 for any $\vec{v}, \vec{w} \in V$.

2.
$$T(c\vec{v}) = cT(\vec{v})$$
 for any $c \in \mathbb{R}, \vec{v} \in V$.

In other words, a map is linear when vector space operations can be applied before or after the transformation without affecting the result.

Activity A.13 (~ 5 min) Suppose $T: \mathbb{R}^3 \to \mathbb{R}^2$ is a linear map, and you know

$$T\left(\begin{bmatrix}1\\0\\0\end{bmatrix}\right) = \begin{bmatrix}2\\1\end{bmatrix} \text{ and } T\left(\begin{bmatrix}0\\0\\1\end{bmatrix}\right) = \begin{bmatrix}-3\\2\end{bmatrix}. \text{ Compute } T\left(\begin{bmatrix}3\\0\\0\end{bmatrix}\right).$$

(a)
$$\begin{bmatrix} 6 \\ 3 \end{bmatrix}$$

(c)
$$\begin{bmatrix} -4 \\ -2 \end{bmatrix}$$

(b)
$$\begin{bmatrix} -9 \\ 6 \end{bmatrix}$$

(d)
$$\begin{bmatrix} 6 \\ -4 \end{bmatrix}$$

Activity A.14 (\sim 5 min) Suppose $T:\mathbb{R}^3 \to \mathbb{R}^2$ is a linear map, and you know

$$T\left(\begin{bmatrix}1\\0\\0\end{bmatrix}\right) = \begin{bmatrix}2\\1\end{bmatrix} \text{ and } T\left(\begin{bmatrix}0\\0\\1\end{bmatrix}\right) = \begin{bmatrix}-3\\2\end{bmatrix}. \text{ Compute } T\left(\begin{bmatrix}1\\0\\1\end{bmatrix}\right).$$

(a)
$$\begin{bmatrix} 2 \\ 1 \end{bmatrix}$$

(c)
$$\begin{bmatrix} -1 \\ 3 \end{bmatrix}$$

(b)
$$\begin{bmatrix} 3 \\ -1 \end{bmatrix}$$

d)
$$\begin{bmatrix} 5 \\ -8 \end{bmatrix}$$

Activity A.15 (~ 5 min) Suppose $T: \mathbb{R}^3 \to \mathbb{R}^2$ is a linear map, and you know

$$T\left(\begin{bmatrix}1\\0\\0\end{bmatrix}\right) = \begin{bmatrix}2\\1\end{bmatrix} \text{ and } T\left(\begin{bmatrix}0\\0\\1\end{bmatrix}\right) = \begin{bmatrix}-3\\2\end{bmatrix}. \text{ Compute } T\left(\begin{bmatrix}-2\\0\\-3\end{bmatrix}\right).$$

(a)
$$\begin{bmatrix} 2 \\ 1 \end{bmatrix}$$

(b)
$$\begin{bmatrix} 3 \\ -1 \end{bmatrix}$$

(c)
$$\begin{bmatrix} -1 \\ 3 \end{bmatrix}$$

(d)
$$\begin{bmatrix} 5 \\ -8 \end{bmatrix}$$

Activity A.16 (~ 5 min) Suppose $T: \mathbb{R}^3 \to \mathbb{R}^2$ is a linear map, and you know

$$T\left(\begin{bmatrix}1\\0\\0\end{bmatrix}\right) = \begin{bmatrix}2\\1\end{bmatrix} \text{ and } T\left(\begin{bmatrix}0\\0\\1\end{bmatrix}\right) = \begin{bmatrix}-3\\2\end{bmatrix}.$$

What piece of information would help you compute $T \begin{pmatrix} \begin{bmatrix} 0 \\ 4 \\ -1 \end{bmatrix} \end{pmatrix}$?

- (a) The value of $T \begin{pmatrix} 0 \\ -4 \\ 0 \end{pmatrix}$.
- (b) The value of $T \begin{pmatrix} \begin{bmatrix} 0 \\ 1 \\ 0 \end{bmatrix} \end{pmatrix}$.

- (c) The value of $T \begin{pmatrix} 1 \\ 1 \\ 1 \end{pmatrix}$.
- (d) Any of the above.

Fact A.17

Consider any basis $\{\vec{b}_1, \dots, \vec{b}_n\}$ for V. Since every vector \vec{v} can be written as a linear combination of basis vectors, $x_1\vec{b}_1 + \dots + x_n\vec{b}_n$, we may compute $T(\vec{v})$ as follows:

$$T(\overrightarrow{v}) = T(x_1\overrightarrow{b}_1 + \cdots + x_n\overrightarrow{b}_n) = x_1T(\overrightarrow{b}_1) + \cdots + x_nT(\overrightarrow{b}_n).$$

Therefore any linear transformation $T: V \to W$ can be defined by just describing the values of $T(\vec{b}_i)$.

Put another way, the images of the basis vectors **determine** the transformation T.

Definition A.18

Since linear transformation $T: \mathbb{R}^n \to \mathbb{R}^m$ is determined by the standard basis $\{\vec{e}_1, \dots, \vec{e}_n\}$, it's convenient to store this information in the $m \times n$ standard matrix $[T(\vec{e}_1) \cdots T(\vec{e}_n)]$.

For example, let $T: \mathbb{R}^3 \to \mathbb{R}^2$ be the linear map determined by the following values for T applied to the standard basis of \mathbb{R}^3 .

$$T\left(\vec{e}_{1}\right) = T\left(\begin{bmatrix}1\\0\\0\end{bmatrix}\right) = \begin{bmatrix}3\\2\end{bmatrix} \qquad T\left(\vec{e}_{2}\right) = T\left(\begin{bmatrix}0\\1\\0\end{bmatrix}\right) = \begin{bmatrix}-1\\4\end{bmatrix} \qquad T\left(\vec{e}_{3}\right) = T\left(\begin{bmatrix}0\\0\\1\end{bmatrix}\right) = \begin{bmatrix}5\\0\end{bmatrix}$$

Then the standard matrix corresponding to T is

$$\begin{bmatrix} T(\vec{e}_1) & T(\vec{e}_2) & T(\vec{e}_3) \end{bmatrix} = \begin{bmatrix} 3 & -1 & 5 \\ 2 & 4 & 0 \end{bmatrix}.$$

Activity A.19 (~ 3 min) Let $T: \mathbb{R}^4 \to \mathbb{R}^3$ be the linear transformation given by

$$T\left(\vec{\mathbf{e}}_{1}\right) = \begin{bmatrix} 0\\3\\-2 \end{bmatrix} \qquad T\left(\vec{\mathbf{e}}_{2}\right) = \begin{bmatrix} -3\\0\\1 \end{bmatrix} \qquad T\left(\vec{\mathbf{e}}_{3}\right) = \begin{bmatrix} 4\\-2\\1 \end{bmatrix} \qquad T\left(\vec{\mathbf{e}}_{4}\right) = \begin{bmatrix} 2\\0\\0 \end{bmatrix}$$

Write the standard matrix $[T(\vec{e}_1) \cdots T(\vec{e}_n)]$ for T.

Section 2

Activity A.20 (~ 5 min) Let $T: \mathbb{R}^3 \to \mathbb{R}^2$ be the linear transformation given by

$$T\left(\begin{bmatrix} x \\ y \\ z \end{bmatrix}\right) = \begin{bmatrix} x + 3z \\ 2x - y - 4z \end{bmatrix}$$

Section 2

Activity A.20 (~ 5 min) Let $T: \mathbb{R}^3 \to \mathbb{R}^2$ be the linear transformation given by

$$T\left(\begin{bmatrix} x \\ y \\ z \end{bmatrix}\right) = \begin{bmatrix} x + 3z \\ 2x - y - 4z \end{bmatrix}$$

Part 1: Compute $T(\vec{e}_1)$, $T(\vec{e}_2)$, and $T(\vec{e}_3)$.

Activity A.20 (~ 5 min) Let $T: \mathbb{R}^3 \to \mathbb{R}^2$ be the linear transformation given by

$$T\left(\begin{bmatrix} x \\ y \\ z \end{bmatrix}\right) = \begin{bmatrix} x + 3z \\ 2x - y - 4z \end{bmatrix}$$

Part 1: Compute $T(\vec{e}_1)$, $T(\vec{e}_2)$, and $T(\vec{e}_3)$.

Part 2: Find the standard matrix for T.

Fact A.21

Because every linear map $T: \mathbb{R}^m \to \mathbb{R}^n$ has a linear combination of the variables in each component, and thus $T(\vec{e}_i)$ yields exactly the coefficients of x_i , the standard matrix for T is simply an ordered list of the coefficients of the x_i :

$$T\left(\begin{bmatrix} x \\ y \\ z \\ w \end{bmatrix}\right) = \begin{bmatrix} ax + by + cz + dw \\ ex + fy + gz + hw \end{bmatrix} \qquad A = \begin{bmatrix} a & b & c & d \\ e & f & g & h \end{bmatrix}$$

Section 2

Activity A.22 (~ 5 min) Let $T: \mathbb{R}^3 \to \mathbb{R}^3$ be the linear transformation given by the standard matrix

$$\begin{bmatrix} 3 & -2 & -1 \\ 4 & 5 & 2 \\ 0 & -2 & 1 \end{bmatrix}.$$

Activity A.22 (~ 5 min) Let $T: \mathbb{R}^3 \to \mathbb{R}^3$ be the linear transformation given by the standard matrix

$$\begin{bmatrix} 3 & -2 & -1 \\ 4 & 5 & 2 \\ 0 & -2 & 1 \end{bmatrix}.$$

Part 1: Compute
$$T \begin{pmatrix} 1 \\ 2 \\ 3 \end{pmatrix}$$
.

Activity A.22 (~ 5 min) Let $T: \mathbb{R}^3 \to \mathbb{R}^3$ be the linear transformation given by the standard matrix

$$\begin{bmatrix} 3 & -2 & -1 \\ 4 & 5 & 2 \\ 0 & -2 & 1 \end{bmatrix}.$$

Part 1: Compute
$$T \begin{pmatrix} 1 \\ 2 \\ 3 \end{pmatrix}$$
.

Part 2: Compute $T \begin{pmatrix} x \\ y \\ z \end{pmatrix}$.

Part 2: Compute
$$T \begin{pmatrix} x \\ y \\ z \end{pmatrix}$$

Definition A.29

Let $T:V\to W$ be a linear transformation. The **image** of T is an important subspace of W defined by

$$\mathsf{Im}\; T = \left\{ \vec{\mathsf{w}} \in W \;\middle|\; \mathsf{there}\; \mathsf{is}\; \mathsf{some}\; \vec{\mathsf{v}} \in V \;\mathsf{with}\; T(\vec{\mathsf{v}}) = \vec{\mathsf{w}} \right\}$$

In the examples below, the left example's image is all of \mathbb{R}^2 , but the right example's image is a planar subspace of \mathbb{R}^3 .

Activity A.30 (\sim 5 min) Let $T: \mathbb{R}^2 \to \mathbb{R}^3$ be given by

$$T\left(\begin{bmatrix} x \\ y \end{bmatrix}\right) = \begin{bmatrix} x \\ y \\ 0 \end{bmatrix} \qquad \text{with standard matrix } \begin{bmatrix} 1 & 0 \\ 0 & 1 \\ 0 & 0 \end{bmatrix}$$

Which of these subspaces of \mathbb{R}^3 describes Im T, the set of all vectors that are the result of using T to transform \mathbb{R}^2 vectors?

$$\mathsf{a})\ \left\{ \begin{bmatrix} \mathsf{0} \\ \mathsf{0} \\ \mathsf{a} \end{bmatrix} \,\middle|\, \mathsf{a} \in \mathbb{R} \right\}$$

b)
$$\left\{ \begin{bmatrix} a \\ b \\ 0 \end{bmatrix} \middle| a, b \in \mathbb{R} \right\}$$

c)
$$\left\{ \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix} \right\}$$

$$\mathsf{d}) \ \mathbb{R}^3 = \left\{ \begin{bmatrix} x \\ y \\ z \end{bmatrix} \middle| x, y, z \in \mathbb{R} \right\}$$

Activity A.31 (\sim 5 min) Let $T: \mathbb{R}^3 \to \mathbb{R}^2$ be given by

$$T\left(\begin{bmatrix} x \\ y \\ z \end{bmatrix}\right) = \begin{bmatrix} x \\ y \end{bmatrix} \qquad \text{with standard matrix } \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \end{bmatrix}$$

Which of these subspaces of \mathbb{R}^2 describes Im T, the set of all vectors that are the result of using T to transform \mathbb{R}^3 vectors?

$$\mathsf{a})\ \left\{ \begin{bmatrix} a \\ a \end{bmatrix} \,\middle|\, a \in \mathbb{R} \right\}$$

b)
$$\left\{ \begin{bmatrix} 0 \\ 0 \end{bmatrix} \right\}$$

c)
$$\mathbb{R}^2 = \left\{ \begin{bmatrix} x \\ y \end{bmatrix} \middle| x, y \in \mathbb{R} \right\}$$

Activity A.32 (~ 5 min) Let $T: \mathbb{R}^4 \to \mathbb{R}^3$ be the linear transformation given by the standard matrix

$$A = \begin{bmatrix} 3 & 4 & 7 & 1 \\ -1 & 1 & 0 & 2 \\ 2 & 1 & 3 & -1 \end{bmatrix} = \begin{bmatrix} T(\vec{e}_1) & T(\vec{e}_2) & T(\vec{e}_3) & T(\vec{e}_4) \end{bmatrix}.$$

Since $T(\vec{v}) = T(x_1\vec{e}_1 + x_2\vec{e}_2 + x_3\vec{e}_3 + x_4\vec{e}_4)$, the set of vectors

$$\left\{ \begin{bmatrix} 3\\-1\\2 \end{bmatrix}, \begin{bmatrix} 4\\1\\1 \end{bmatrix}, \begin{bmatrix} 7\\0\\3 \end{bmatrix}, \begin{bmatrix} 1\\2\\-1 \end{bmatrix} \right\}$$

- a) spans Im T
- b) is a linearly independent subset of Im T
- c) is a basis for Im T

Observation A.33

Let $T: \mathbb{R}^4 \to \mathbb{R}^3$ be the linear transformation given by the standard matrix

$$A = \begin{bmatrix} 3 & 4 & 7 & 1 \\ -1 & 1 & 0 & 2 \\ 2 & 1 & 3 & -1 \end{bmatrix}.$$

Since the set
$$\left\{ \begin{bmatrix} 3 \\ -1 \\ 2 \end{bmatrix}, \begin{bmatrix} 4 \\ 1 \\ 1 \end{bmatrix}, \begin{bmatrix} 7 \\ 0 \\ 3 \end{bmatrix}, \begin{bmatrix} 1 \\ 2 \\ -1 \end{bmatrix} \right\}$$
 spans Im T , we can obtain a basis for $\begin{bmatrix} 1 & 0 & 1 & -1 \\ 0 & 1 & 1 & 1 \end{bmatrix}$

Im T by finding RREF $A = \begin{bmatrix} 1 & 0 & 1 & -1 \\ 0 & 1 & 1 & 1 \\ 0 & 0 & 0 & 0 \end{bmatrix}$ and only using the vectors

corresponding to pivot columns:

$$\left\{ \begin{bmatrix} 3\\-1\\2 \end{bmatrix}, \begin{bmatrix} 4\\1\\1 \end{bmatrix} \right\}$$

Fact A.34

Let $T: \mathbb{R}^n \to \mathbb{R}^m$ be a linear transformation with standard matrix A.

- The kernel of T is the solution set of the homogeneous system given by the augmented matrix $\begin{bmatrix} A & \vec{0} \end{bmatrix}$. Use the coefficients of its free variables to get a basis for the kernel.
- The image of *T* is the span of the columns of *A*. Remove the vectors creating non-pivot columns in RREF *A* to get a basis for the image.

Activity A.35 (~ 10 min) Let $T: \mathbb{R}^3 \to \mathbb{R}^4$ be the linear transformation given by the standard matrix

$$A = \begin{bmatrix} 1 & -3 & 2 \\ 2 & -6 & 0 \\ 0 & 0 & 1 \\ -1 & 3 & 1 \end{bmatrix}.$$

Find a basis for the kernel and a basis for the image of T.

Section 4

Observation A.38

Combining these with the observation that the number of columns is the dimension of the domain of T, we have the **rank-nullity theorem**:

The dimension of the domain of T equals $\dim(\ker T) + \dim(\operatorname{Im} T)$.

The dimension of the image is called the **rank** of T (or A) and the dimension of the kernel is called the **nullity**.

Section 5

Activity A.39 (~ 10 min) Let $T: \mathbb{R}^3 \to \mathbb{R}^4$ be the linear transformation given by the standard matrix

$$A = \begin{bmatrix} 1 & -3 & 2 \\ 2 & -6 & 0 \\ 0 & 0 & 1 \\ -1 & 3 & 1 \end{bmatrix}.$$

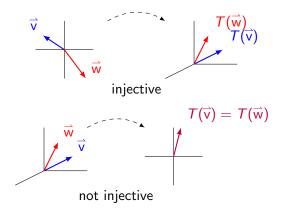

Verify that the rank-nullity theorem holds for T.

Module A

Section 1 Section 2 Section 3 Section 4 Section 5

Definition A.40

Let $T: V \to W$ be a linear transformation. T is called **injective** or **one-to-one** if T does not map two distinct vectors to the same place. More precisely, T is injective if $T(\vec{v}) \neq T(\vec{w})$ whenever $\vec{v} \neq \vec{w}$.

Activity A.41 (~ 3 min) Let $T: \mathbb{R}^3 \to \mathbb{R}^2$ be given by

$$T\left(\begin{bmatrix} x \\ y \\ z \end{bmatrix}\right) = \begin{bmatrix} x \\ y \end{bmatrix} \qquad \text{with standard matrix } \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \end{bmatrix}$$

Is T injective?

- a) Yes, because $T(\vec{v}) = T(\vec{w})$ whenever $\vec{v} = \vec{w}$.
- b) Yes, because $T(\vec{v}) \neq T(\vec{w})$ whenever $\vec{v} \neq \vec{w}$.

c) No, because
$$T\left(\begin{bmatrix}0\\0\\1\end{bmatrix}\right) \neq T\left(\begin{bmatrix}0\\0\\2\end{bmatrix}\right)$$

d) No, because
$$T \begin{pmatrix} \begin{bmatrix} 0 \\ 0 \\ 1 \end{bmatrix} \end{pmatrix} = T \begin{pmatrix} \begin{bmatrix} 0 \\ 0 \\ 2 \end{bmatrix} \end{pmatrix}$$

Activity A.42 (~ 2 min) Let $T: \mathbb{R}^2 \to \mathbb{R}^3$ be given by

$$T\left(\begin{bmatrix} x \\ y \end{bmatrix}\right) = \begin{bmatrix} x \\ y \\ 0 \end{bmatrix} \qquad \text{with standard matrix } \begin{bmatrix} 1 & 0 \\ 0 & 1 \\ 0 & 0 \end{bmatrix}$$

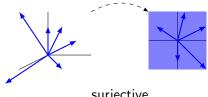

Is T injective?

- a) Yes, because $T(\vec{v}) = T(\vec{w})$ whenever $\vec{v} = \vec{w}$.
- b) Yes, because $T(\vec{v}) \neq T(\vec{w})$ whenever $\vec{v} \neq \vec{w}$.
- c) No, because $T\left(\begin{bmatrix}1\\2\end{bmatrix}\right) \neq T\left(\begin{bmatrix}3\\4\end{bmatrix}\right)$
- d) No, because $T\left(\begin{bmatrix}1\\2\end{bmatrix}\right) = T\left(\begin{bmatrix}3\\4\end{bmatrix}\right)$

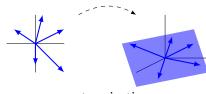

Section 5

Definition A.43

Let $T: V \to W$ be a linear transformation. T is called **surjective** or **onto** if every element of W is mapped to by an element of V. More precisely, for every $\vec{w} \in W$, there is some $\vec{v} \in V$ with $T(\vec{v}) = \vec{w}$.

not surjective

Activity A.44 (\sim 3 min) Let $T: \mathbb{R}^2 \to \mathbb{R}^3$ be given by

$$T\left(\begin{bmatrix} x \\ y \end{bmatrix}\right) = \begin{bmatrix} x \\ y \\ 0 \end{bmatrix} \qquad \text{with standard matrix } \begin{bmatrix} 1 & 0 \\ 0 & 1 \\ 0 & 0 \end{bmatrix}$$

Is *T* surjective?

- a) Yes, because for every $\vec{w} = \begin{bmatrix} x \\ y \\ z \end{bmatrix} \in \mathbb{R}^3$, there exists $\vec{v} = \begin{bmatrix} x \\ y \end{bmatrix} \in \mathbb{R}^2$ such that $T(\vec{v}) = \vec{w}$.
- b) No, because $T\left(\begin{bmatrix} x \\ y \end{bmatrix}\right)$ can never equal $\begin{bmatrix} 1 \\ 1 \\ 1 \end{bmatrix}$.
- c) No, because $T\left(\begin{bmatrix} x \\ y \end{bmatrix}\right)$ can never equal $\begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$.

Module A

Section Section

Section Section

Section

Section 5

Activity A.45 (\sim 2 min) Let $T: \mathbb{R}^3 \to \mathbb{R}^2$ be given by

$$T\left(\begin{bmatrix} x \\ y \\ z \end{bmatrix}\right) = \begin{bmatrix} x \\ y \end{bmatrix} \qquad \text{with standard matrix } \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \end{bmatrix}$$

Is *T* surjective?

- a) Yes, because for every $\vec{w} = \begin{bmatrix} x \\ y \end{bmatrix} \in \mathbb{R}^2$, there exists $\vec{v} = \begin{bmatrix} x \\ y \\ 42 \end{bmatrix} \in \mathbb{R}^3$ such that $T(\vec{v}) = \vec{w}$.
- b) Yes, because for every $\vec{\mathbf{w}} = \begin{bmatrix} x \\ y \end{bmatrix} \in \mathbb{R}^2$, there exists $\vec{\mathbf{v}} = \begin{bmatrix} 0 \\ 0 \\ z \end{bmatrix} \in \mathbb{R}^3$ such that $T(\vec{\mathbf{v}}) = \vec{\mathbf{w}}$.
- c) No, because $T \begin{pmatrix} x \\ y \\ z \end{pmatrix}$ can never equal $\begin{bmatrix} 3 \\ -2 \end{bmatrix}$.

Observation A.46

As we will see, it's no coincidence that the RREF of the injective map's standard matrix

 $\begin{bmatrix} 1 & 0 \\ 0 & 1 \\ 0 & 0 \end{bmatrix}$

has all pivot columns. Similarly, the RREF of the surjective map's standard matrix

$$\begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \end{bmatrix}$$

has a pivot in each row.

Section 5

Observation A.47

Let $T: V \to W$. We have previously defined the following terms.

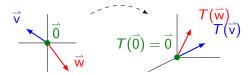

- The **kernel** of T is the set of all vectors in V that are mapped to $\vec{z} \in W$. It is a subspace of V.
- The **image** of T is the set of all vectors in W that are mapped to by something in V. It is a subspace of W.
- T is called injective or one-to-one if T always maps distinct vectors to different places.
- T is called surjective or onto if every element of W is mapped to by some element of V.

Activity A.48 (\sim 5 min) Let $T: V \rightarrow W$ be a linear transformation where ker Tcontains multiple vectors. What can you conclude?

- (a) T is injective
- (b) T is not injective
- (c) T is surjective
- (d) T is not surjective

Fact A.49

A linear transformation T is injective if and only if ker $T = \{\vec{0}\}$. Put another way, an injective linear transformation may be recognized by its trivial kernel.

Module A

Section 1 Section 2

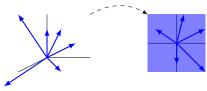

Section

Section 4 Section 5 **Activity A.50** (~ 5 min) Let $T:V\to\mathbb{R}^5$ be a linear transformation where Im T is spanned by four vectors. What can you conclude?

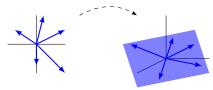

- (a) T is injective
- (b) T is not injective
- (c) T is surjective
- (d) T is not surjective

Fact A.51

A linear transformation $T: V \to W$ is surjective **if and only if** Im T = W. Put another way, a surjective linear transformation may be recognized by its identical codomain and image.

surjective, Im $T=\mathbb{R}^2$

not surjective, Im $T \neq \mathbb{R}^3$

Today's goals: Today we will learn about **bijective** linear maps. This will be needed when we learn about **invertible matrices** (Standard M2).

Activity A.52 (\sim 15 min) Let $T: \mathbb{R}^n \to \mathbb{R}^m$ be a linear map with standard matrix A. Sort the following claims into two groups of *equivalent* statements: one group that means T is **injective**, and one group that means T is **surjective**.

- (a) The kernel of T is trivial, i.e. $\ker T = \{\vec{0}\}.$
- (b) The columns of A span \mathbb{R}^m .
- (c) The columns of A are linearly independent.
- (d) Every column of RREF(A) has a pivot.
- (e) Every row of RREF(A) has a pivot.
- (f) The image of T equals its codomain, i.e. Im $T = \mathbb{R}^m$.

- (g) The system of linear equations given by the augmented matrix $\begin{bmatrix} A & \vec{b} \end{bmatrix}$ has a solution for all $\vec{b} \in \mathbb{R}^m$.
- (h) The system of linear equations given by the augmented matrix $\begin{bmatrix} A \mid \vec{0} \end{bmatrix}$ has exactly one solution.

Quick Check A.53

The easiest way to determine if the linear map with standard matrix A is injective is to see if RREF(A) has a pivot in each column.

The easiest way to determine if the linear map with standard matrix A is surjective is to see if RREF(A) has a pivot in each row.

Activity A.54 (~3 min) What can you conclude about the linear map

$$T: \mathbb{R}^2 \to \mathbb{R}^3$$
 with standard matrix $\begin{bmatrix} a & b \\ c & d \\ e & f \end{bmatrix}$?

- a) Its standard matrix has more columns than rows, so T is not injective.
- b) Its standard matrix has more columns than rows, so T is injective.
- c) Its standard matrix has more rows than columns, so T is not surjective.
- d) Its standard matrix has more rows than columns, so $\mathcal T$ is surjective.

Activity A.55 (\sim 2 min) What can you conclude about the linear map

$$T: \mathbb{R}^3 \to \mathbb{R}^2$$
 with standard matrix $\begin{bmatrix} a & b & c \\ d & e & f \end{bmatrix}$?

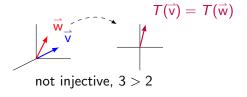

- a) Its standard matrix has more columns than rows, so T is not injective.
- b) Its standard matrix has more columns than rows, so T is injective.
- c) Its standard matrix has more rows than columns, so T is not surjective.
- d) Its standard matrix has more rows than columns, so T is surjective.

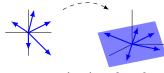

Fact A.56

The following are true for any linear map $T: V \to W$:

- If dim(V) > dim(W), then T is not injective.
- If dim(V) < dim(W), then T is not surjective.

Basically, a linear transformation cannot reduce dimension without collapsing vectors into each other, and a linear transformation cannot increase dimension from its domain to its image.

not surjective, 2 < 3

But dimension arguments cannot be used to prove a map is injective or surjective.

Activity A.57 (\sim 5 min) Suppose $T: \mathbb{R}^n \to \mathbb{R}^4$ with standard matrix

$$A = \begin{bmatrix} a_{11} & a_{12} & \cdots & a_{1n} \\ a_{21} & a_{22} & \cdots & a_{2n} \\ a_{31} & a_{32} & \cdots & a_{3n} \\ a_{41} & a_{42} & \cdots & a_{4n} \end{bmatrix}$$
 is both injective and surjective (we call such maps bijective).
