Section E.2

Activity E.2.1 ($\sim 10 \ min)$ Free browser-based technologies for mathematical computation are available online.

- Go to http://cocalc.com and create an account.
- Create a project titled "Linear Algebra Team X" with your appropriate team number. Add all team members as collaborators.
- Open the project and click on "New"
- Give it an appropriate name such as "Class E.2 workbook". Make a new Jupyter notebook.
- Click on "Kernel" and make sure "Octave" is selected.
- Type A=[1 3 4; 2 5 7] and press Shift+Enter to store the matrix $\begin{bmatrix} 1 & 3 & 4 \\ 2 & 5 & 7 \end{bmatrix}$ in the variable A.
- Type rref(A) and press Shift+Enter to compute the reduced row echelon form of A.

Remark E.2.2 If you need to find the reduced row echelon form of a matrix during class, you are encouraged to use CoCalc's Octave interpreter.

You can change a cell from "Code" to "Markdown" or "Raw" to put comments around your calculations such as Activity numbers.

Activity E.2.3 ($\sim 10 \text{ min}$) Consider the system of equations.

$$3x_1 - 2x_2 + 13x_3 = 6$$

$$2x_1 - 2x_2 + 10x_3 = 2$$

$$-x_1 + 3x_2 - 6x_3 = 11$$

Convert this to an augmented matrix and use CoCalc to compute its reduced row echelon form. Write these on your whiteboard, and use them to write a simpler yet equivalent linear system of equations. Then find its solution set.

Activity E.2.4 (~10 min) Consider our system of equations from above.

$$3x_1 - 2x_2 + 13x_3 = 6$$
$$2x_1 - 2x_2 + 10x_3 = 2$$
$$-x_1 - 3x_3 = 1$$

Convert this to an augmented matrix and use CoCalc to compute its reduced row echelon form. Write these on your whiteboard, and use them to write a simpler yet equivalent linear system of equations. Then find its solution set.

Activity E.2.5 ($\sim 10 \text{ min}$) Consider the following linear system.

$$x_1 + 2x_2 + 3x_3 = 1$$
$$2x_1 + 4x_2 + 8x_3 = 0$$

Part 1: Find its corresponding augmented matrix A and use CoCalc to find RREF(A).

Part 2: How many solutions does the corresponding linear system have?

Activity E.2.6 (~ 10 min) Consider the simple linear system equivalent to the system from the previous problem:

$$x_1 + 2x_2 = 4$$
$$x_3 = -1$$

Part 1: Let $x_1 = a$ and write the solution set in the form $\left\{ \begin{bmatrix} a \\ ? \\ ? \end{bmatrix} \middle| a \in \mathbb{R} \right\}$.

Part 2: Let $x_2 = b$ and write the solution set in the form $\left\{ \begin{bmatrix} ? \\ b \\ ? \end{bmatrix} \middle| b \in \mathbb{R} \right\}$.

Part 3: Which of these was easier? What features of the RREF matrix $\begin{bmatrix} 1 & 2 & 0 & 4 \\ 0 & 0 & 1 & -1 \end{bmatrix}$ caused this?

Definition E.2.7 Recall that the pivots of a matrix in RREF form are the leading 1s in each non-zero row.

The pivot columns in an augmented matrix correspond to the **bound variables** in the system of equations $(x_1, x_3 \text{ below})$. The remaining variables are called **free variables** $(x_2 \text{ below})$.

$$\begin{bmatrix}
1 & 2 & 0 & | & 4 \\
0 & 0 & 1 & | & -1
\end{bmatrix}$$

To efficiently solve a system in RREF form, we may assign letters to free variables and solve for the bound variables.

Activity E.2.8 ($\sim 10 \text{ min}$) Find the solution set for the system

$$2x_1 - 2x_2 - 6x_3 + x_4 - x_5 = 3$$
$$-x_1 + x_2 + 3x_3 - x_4 + 2x_5 = -3$$
$$x_1 - 2x_2 - x_3 + x_4 + x_5 = 2$$

by row-reducing its augmented matrix, and then assigning letters to the free variables (given by non-pivot columns) and solving for the bound variables (given by pivot columns) in the corresponding linear system.

Observation E.2.9 The solution set to the system

$$2x_1 - 2x_2 - 6x_3 + x_4 - x_5 = 3$$
$$-x_1 + x_2 + 3x_3 - x_4 + 2x_5 = -3$$
$$x_1 - 2x_2 - x_3 + x_4 + x_5 = 2$$

may be written as

$$\left\{ \begin{bmatrix} 1+5a+2b\\1+2a+3b\\a\\3+3b\\b \end{bmatrix} \middle| a,b \in \mathbb{R} \right\}.$$

Remark E.2.10 Don't forget to correctly express the solution set of a linear system, using set-builder notation for consistent systems with infintely many solutions.

- Consistent with one solution: e.g. $\left\{ \begin{bmatrix} 1\\2\\3 \end{bmatrix} \right\}$
- Consistent with infinitely-many solutions: e.g. $\left\{\begin{bmatrix}1\\2-3a\\a\end{bmatrix}\middle|a\in\mathbb{R}\right\}$
- Inconsistent: \emptyset
