## Application Activities - Module E Part 2 - Class Day 4

**Definition 4.1** The following **row operations** produce equivalent augmented matrices:

- 1. Swap two rows.
- 2. Multiply a row by a nonzero constant.
- 3. Add a constant multiple of one row to another row.

Whenever two matrices A, B are equivalent (so whenever we do any of these operations), we write  $A \sim B$ .

Activity 4.2 Consider the following two linear systems.

$$3x_1 - 2x_2 + 13x_3 = 6$$
  $x_1 - x_2 + 5x_3 = 1$   $2x_1 - 2x_2 + 10x_3 = 2$   $x_2 - 2x_3 = 3$   $-1x_1 + 3x_2 - 6x_3 = 11$   $x_3 = 2$ 

Part 1: Show these are equivalent by converting the first system to an augmented matrix, and then performing the following row operations to obtain an augmented matrix equivalent to the second system.

- 1. Swap  $R_1$  (first row) and  $R_2$  (second row).
- 4. Add  $-3R_1$  to  $R_2$ .

2. Multiply  $R_2$  by  $\frac{1}{2}$ .

5. Add  $-2R_2$  to  $R_3$ .

3. Add  $R_1$  to  $R_3$ .

6. Multiply  $R_3$  by  $\frac{1}{3}$ .

Part 2: Which linear system would you rather solve?

**Definition 4.3** The **leading term** of a matrix row is its first nonzero term. A matrix is in **row echelon form** if all leading terms are 1, the leading term of every row is farther right than every leading term on a higher row, and all zero rows are at the bottom of the matrix. Examples:

$$\begin{bmatrix} 1 & -1 & 5 & | & 1 \\ 0 & 1 & -2 & | & 3 \\ 0 & 0 & 1 & | & 2 \end{bmatrix} \qquad \begin{bmatrix} 1 & -1 & 5 & | & 1 \\ 0 & 0 & 1 & | & 3 \\ 0 & 0 & 0 & | & 1 \end{bmatrix} \qquad \begin{bmatrix} 1 & -1 & 5 & | & 1 \\ 0 & 0 & 1 & | & 3 \\ 0 & 0 & 0 & | & 0 \end{bmatrix}$$

Activity 4.4 Find your own sequence of row operations to manipulate the matrix

$$\begin{bmatrix} 3 & -2 & 13 & 6 \\ 2 & -2 & 10 & 2 \\ -1 & 3 & -6 & 11 \end{bmatrix}$$

into row echelon form. (Note that row echelon form is not unique.)

The most efficient way to do this is by circling **pivot positions** in your matrix:

1. Circle the top-left-most cell that (a) is below any existing pivot positions and (b) has a nonzero term either in that position or below it.

- 2. Ignoring any rows above this pivot position, use row operations to change the value of your pivot position to 1, and the terms below it to 0.
- 3. Repeat these two steps as often as possible.

Activity 4.5 Solve this simplified linear system:

$$x_1 - x_2 + 5x_3 = 1$$
$$x_2 - 2x_3 = 3$$
$$x_3 = 2$$

**Observation 4.6** The consise standard form of the solution to this linear system corresponds to a simplified row echelon form matrix:

$$\begin{array}{rcl}
x_1 & = -2 \\
x_2 & = 7 \\
x_3 & = 2
\end{array} \qquad \begin{bmatrix}
1 & 0 & 0 & | & -2 \\
0 & 1 & 0 & | & 7 \\
0 & 0 & 1 & | & 2
\end{bmatrix}$$

**Definition 4.7** A matrix is in **reduced row echelon form** if it is in row echelon form and all terms above leading terms are 0. Examples:

$$\begin{bmatrix} 1 & 0 & 0 & | & -2 \\ 0 & 1 & 0 & | & 7 \\ 0 & 0 & 1 & | & 2 \end{bmatrix} \qquad \begin{bmatrix} 1 & 0 & -2 & | & 0 \\ 0 & 1 & 3 & | & 0 \\ 0 & 0 & 0 & | & 1 \end{bmatrix} \qquad \begin{bmatrix} 1 & 3 & 0 & | & -2 \\ 0 & 0 & 1 & | & 7 \\ 0 & 0 & 0 & | & 0 \end{bmatrix}$$

**Activity 4.8** Show that the following two linear systems:

$$x_1 - x_2 + 5x_3 = 1$$
  $x_1 = -2$   
 $x_2 - 2x_3 = 3$   $x_2 = 7$   
 $x_3 = 2$   $x_3 = 2$ 

are equivalent by converting the first system to an augmented matrix, and then zeroing out all terms above pivot positions (the leading terms).

**Remark 4.9** We may verify that 
$$\begin{bmatrix} x_1 \\ x_2 \\ x_3 \end{bmatrix} = \begin{bmatrix} -2 \\ 7 \\ 2 \end{bmatrix}$$
 is a solution to the original linear system 
$$3x_1 - 2x_2 + 13x_3 = 6$$
$$2x_1 - 2x_2 + 10x_3 = 2$$
$$-1x_1 + 3x_2 - 6x_3 = 11$$

by plugging the solution into each equation.

Fact 4.10 Every augmented matrix A reduces to a unique reduced row echelon form matrix. This matrix is denoted as RREF(A).

Activity 4.11 Consider the following matrix.

$$A = \begin{bmatrix} 1 & 2 & 3 & 1 \\ 2 & 4 & 8 & 0 \end{bmatrix}$$

Part 1: Find RREF(A).

Part 2: How many solutions does the corresponding linear system have?
