Module A: Algebraic properties of linear maps

Math 237

#### Module A Section A.1

Section A.2 Section A.3 Section A.4

How can we understand linear maps algebraically?

At the end of this module, students will be able to...

- **A1. Linear map verification.** ... determine if a map between vector spaces of polynomials is linear or not.
- **A2. Linear maps and matrices.** ... translate back and forth between a linear transformation of Euclidean spaces and its standard matrix, and perform related computations.
- **A3. Injectivity and surjectivity.** ... determine if a given linear map is injective and/or surjective.
- **A4. Kernel and Image.** ... compute a basis for the kernel and a basis for the image of a linear map.

#### Module A Section A.1 Section A.2 Section A.3 Section A.4

#### **Readiness Assurance Outcomes**

Before beginning this module, each student should be able to...

- State the definition of a spanning set, and determine if a set of Euclidean vectors spans  $\mathbb{R}^n$  **V4**.
- State the definition of linear independence, and determine if a set of Euclidean vectors is linearly dependent or independent **S1**.
- State the definition of a basis, and determine if a set of Euclidean vectors is a basis S2,S3.
- Find a basis of the solution space to a homogeneous system of linear equations
   \$6.

Section A.1 Section A.2 Section A.3 Section A.4

# Module A Section 1

#### **Definition A.1.1**

A linear transformation (also known as a linear map) is a map between vector spaces that preserves the vector space operations. More precisely, if V and W are vector spaces, a map  $T:V\to W$  is called a linear transformation if

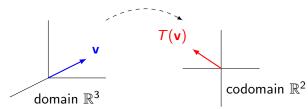

2 
$$T(c\mathbf{v}) = cT(\mathbf{v})$$
 for any  $c \in \mathbb{R}, \mathbf{v} \in V$ .

In other words, a map is linear when vector space operations can be applied before or after the transformation without affecting the result.

#### **Definition A.1.2**

Given a linear transformation  $T: V \to W$ , V is called the **domain** of T and W is called the **co-domain** of T.

Linear transformation  $T: \mathbb{R}^3 \to \mathbb{R}^2$ 

Let  $T: \mathbb{R}^3 \to \mathbb{R}^2$  be given by

Module A Section A.1

$$T\left(\begin{bmatrix} x \\ y \\ z \end{bmatrix}\right) = \begin{bmatrix} x - z \\ 3y \end{bmatrix}$$

To show that T is linear, we must verify...

$$T\left(\begin{bmatrix} x \\ y \\ z \end{bmatrix} + \begin{bmatrix} u \\ v \\ w \end{bmatrix}\right) = T\left(\begin{bmatrix} x+u \\ y+v \\ z+w \end{bmatrix}\right) = \begin{bmatrix} (x+u)-(z+w) \\ 3(y+v) \end{bmatrix}$$

$$T\left(\begin{bmatrix} x \\ y \\ z \end{bmatrix}\right) + T\left(\begin{bmatrix} u \\ v \\ w \end{bmatrix}\right) = \begin{bmatrix} x - z \\ 3y \end{bmatrix} + \begin{bmatrix} u - w \\ 3v \end{bmatrix} = \begin{bmatrix} (x + u) - (z + w) \\ 3(y + v) \end{bmatrix}$$

And also...

$$T\left(c \begin{bmatrix} x \\ y \\ z \end{bmatrix}\right) = T\left(\begin{bmatrix} cx \\ cy \\ cz \end{bmatrix}\right) = \begin{bmatrix} cx - cz \\ 3cy \end{bmatrix} \text{ and } cT\left(\begin{bmatrix} x \\ y \\ z \end{bmatrix}\right) = c\begin{bmatrix} x - z \\ 3y \end{bmatrix} = \begin{bmatrix} cx - cz \\ 3cy \end{bmatrix}$$

Therefore T is a linear transformation.

Section A.1

$$T\left(\begin{bmatrix} x \\ y \end{bmatrix}\right) = \begin{bmatrix} x+y \\ x^2 \\ y+3 \\ y-2x \end{bmatrix}$$

To show that T is not linear, we only need to find one counterexample.

$$T\left(\begin{bmatrix}0\\1\end{bmatrix} + \begin{bmatrix}2\\3\end{bmatrix}\right) = T\left(\begin{bmatrix}2\\4\end{bmatrix}\right) = \begin{bmatrix}6\\4\\7\\0\end{bmatrix}$$

$$T\left(\begin{bmatrix}0\\1\end{bmatrix}\right)+T\left(\begin{bmatrix}2\\3\end{bmatrix}\right)=\begin{bmatrix}1\\0\\4\\1\end{bmatrix}+\begin{bmatrix}5\\4\\6\\-1\end{bmatrix}=\begin{bmatrix}6\\4\\10\\0\end{bmatrix}$$

Since the resulting vectors are different, T is a linear transformation.

Section A.1 Section A.2 Section A.3 Section A.4

## Activity A.1.5 ( $\sim$ 5 min)

Show that  $T: \mathbb{R}^2 \to \mathbb{R}^4$  defined by

$$T\left(\begin{bmatrix} x \\ y \end{bmatrix}\right) = \begin{bmatrix} x+y \\ x^2 \\ y+3 \\ y-2x \end{bmatrix}$$

is not linear by showing that 
$$2T \begin{pmatrix} 1 \\ 1 \end{pmatrix} \neq T \begin{pmatrix} 2 \\ 1 \end{pmatrix}$$
.

Math 237

Section A.1 Section A.2 Section A.3 Section A.4

#### **Fact A.1.6**

A map between Euclidean spaces  $T: \mathbb{R}^n \to \mathbb{R}^m$  is linear exactly when every component of the output is a linear combination of the variables of  $\mathbb{R}^n$ .

#### Example A.1.7

You can quickly identify

$$T\left(\begin{bmatrix} x \\ y \\ z \end{bmatrix}\right) = \begin{bmatrix} x - z \\ 3y \end{bmatrix}$$

as linear because x-z and 3y are linear combinations of x,y,z. But

$$T\left(\begin{bmatrix} x \\ y \end{bmatrix}\right) = \begin{bmatrix} x+y \\ x^2 \\ y+3 \\ y-2x \end{bmatrix}$$

cannot be linear because  $x^2$  and y+3 are not linear combinations of x,y (even though x+y and y-2x are).

Recall the following rules from calculus, where  $D: \mathcal{P} \to \mathcal{P}$  is the derivative map defined by  $D(f) = \frac{df}{dx}$  for each polynomial f.

$$D(f+g) = \frac{df}{dx} + \frac{dg}{dx}$$

$$D(cf) = c\frac{df}{dx}$$

What can we conclude from these rules?

- a)  $\mathcal{P}$  is not a vector space
- b) D is a linear map
- c) D is not a linear map

Consider the following two polynomial maps.

$$S: \mathcal{P}^4 \to \mathcal{P}^3$$
 given by  $S(f(x)) = 2f'(x) - f''(x)$   
 $T: \mathcal{P}^2 \to \mathcal{P}^2$  given by  $T(f(x)) = f'(x) + x^2$ 

Consider the following two polynomial maps.

$$S: \mathcal{P}^4 \to \mathcal{P}^3$$
 given by  $S(f(x)) = 2f'(x) - f''(x)$   
 $T: \mathcal{P}^2 \to \mathcal{P}^2$  given by  $T(f(x)) = f'(x) + x^2$ 

Part 1: Compare  $S(x^2 + x)$  with  $S(x^2) + S(x)$ , and compare  $T(x^2 + x)$  with  $T(x^2) + T(x)$ . Which of these maps is definitely not linear?

Consider the following two polynomial maps.

$$S: \mathcal{P}^4 \to \mathcal{P}^3$$
 given by  $S(f(x)) = 2f'(x) - f''(x)$   
 $T: \mathcal{P}^2 \to \mathcal{P}^2$  given by  $T(f(x)) = f'(x) + x^2$ 

Part 1: Compare  $S(x^2 + x)$  with  $S(x^2) + S(x)$ , and compare  $T(x^2 + x)$  with  $T(x^2) + T(x)$ . Which of these maps is definitely not linear? Part 2: Verify that S(f + g) = 2f'(x) + 2g'(x) - f''(x) - g''(x) is equal to S(f) + S(g) for all polynomials f, g.

Consider the following two polynomial maps.

$$S: \mathcal{P}^4 \to \mathcal{P}^3$$
 given by  $S(f(x)) = 2f'(x) - f''(x)$   
 $T: \mathcal{P}^2 \to \mathcal{P}^2$  given by  $T(f(x)) = f'(x) + x^2$ 

Part 1: Compare  $S(x^2 + x)$  with  $S(x^2) + S(x)$ , and compare  $T(x^2 + x)$  with  $T(x^2) + T(x)$ . Which of these maps is definitely not linear?

Part 2: Verify that S(f+g) = 2f'(x) + 2g'(x) - f''(x) - g''(x) is equal to S(f) + S(g) for all polynomials f, g.

Part 3: Verify that S(cf) = cS(f) for all real numbers c and polynomials f. Is S linear?

#### Math 237

Module A Section A.1 Section A.2 Section A.3 Section A.4

# Module A Section 2

#### Remark A.2.1

Recall that a linear map  $T: V \to W$  satisfies

1 
$$T(\mathbf{v} + \mathbf{w}) = T(\mathbf{v}) + T(\mathbf{w})$$
 for any  $\mathbf{v}, \mathbf{w} \in V$ .

2 
$$T(c\mathbf{v}) = cT(\mathbf{v})$$
 for any  $c \in \mathbb{R}, \mathbf{v} \in V$ .

In other words, a map is linear when vecor space operations can be applied before or after the transformation without affecting the result.

## Activity A.2.2 ( $\sim$ 5 min)

$$\mathcal{T}\left(\begin{bmatrix}0\\0\\1\end{bmatrix}\right) = \begin{bmatrix}-3\\2\end{bmatrix}. \text{ Compute } \mathcal{T}\left(\begin{bmatrix}3\\0\\0\end{bmatrix}\right).$$

(a) 
$$\begin{bmatrix} 6 \\ 3 \end{bmatrix}$$

(c) 
$$\begin{vmatrix} -4 \\ -2 \end{vmatrix}$$

(b) 
$$\begin{bmatrix} -9 \\ 6 \end{bmatrix}$$

(d) 
$$\begin{bmatrix} 6 \\ -4 \end{bmatrix}$$

# Activity A.2.3 ( $\sim$ 3 min)

$$T\left(\begin{bmatrix}0\\0\\1\end{bmatrix}\right) = \begin{bmatrix}-3\\2\end{bmatrix}$$
. Compute  $T\left(\begin{bmatrix}1\\0\\1\end{bmatrix}\right)$ .

(a) 
$$\begin{bmatrix} 2 \\ 1 \end{bmatrix}$$

(c) 
$$\begin{vmatrix} -1 \\ 3 \end{vmatrix}$$

(b) 
$$\begin{bmatrix} 3 \\ -1 \end{bmatrix}$$

(d) 
$$\begin{bmatrix} 5 \\ -8 \end{bmatrix}$$

$$T\left(\begin{bmatrix}0\\0\\1\end{bmatrix}\right) = \begin{bmatrix}-3\\2\end{bmatrix}. \text{ Compute } T\left(\begin{bmatrix}-2\\0\\-3\end{bmatrix}\right).$$

(a) 
$$\begin{bmatrix} 2 \\ 1 \end{bmatrix}$$

(c) 
$$\begin{vmatrix} -1 \\ 3 \end{vmatrix}$$

(b) 
$$\begin{bmatrix} 3 \\ -1 \end{bmatrix}$$

(d) 
$$\begin{bmatrix} 5 \\ -8 \end{bmatrix}$$

## Activity A.2.5 ( $\sim$ 5 min)

$$T\begin{pmatrix} \begin{bmatrix} 0\\0\\1 \end{bmatrix} \end{pmatrix} = \begin{bmatrix} -3\\2 \end{bmatrix}$$
. Do you have enough information to compute  $T(\mathbf{v})$  for any  $\mathbf{v} \in \mathbb{D}^3$ ?

- $\mathbf{v} \in \mathbb{R}^3$ ?
- (a) Yes.
- (b) No, exactly one more piece of information is needed.
- (c) No, an infinite amount of information would be necessary to compute the transformation of infinitely-many vectors.

#### **Fact A.2.6**

Consider any basis  $\{\mathbf{b}_1, \dots, \mathbf{b}_n\}$  for V. Since every vector  $\mathbf{v}$  can be written *uniquely* as a linear combination of basis vectors,  $x_1\mathbf{b}_1 + \dots + x_n\mathbf{b}_n$ , we conclude that

$$T(\mathbf{v}) = T(x_1\mathbf{b}_1 + \cdots + x_n\mathbf{b}_n) = x_1T(\mathbf{b}_1) + \cdots + x_nT(\mathbf{b}_n).$$

Therefore any linear transformation  $T: V \to W$  can be defined by just describing the values of  $T(\mathbf{b}_i)$ .

Put another way, the basis vectors **determine** the transformation T.

Math 237

Section A.1 Section A.2 Section A.3 Section A.4

#### **Definition A.2.7**

Since linear transformation  $T: \mathbb{R}^n \to \mathbb{R}^m$  is determined by the standard basis  $\{\mathbf{e}_1, \dots, \mathbf{e}_n\}$ , it's convenient to store this information in the  $m \times n$  standard matrix  $[T(\mathbf{e}_1) \cdots T(\mathbf{e}_n)]$ .

#### Example A.2.8

Let  $T: \mathbb{R}^3 \to \mathbb{R}^2$  be the linear map determined by the following values for T applied to the standard basis of  $\mathbb{R}^3$ .

$$T(\mathbf{e}_1) = T\begin{pmatrix} \begin{bmatrix} 1\\0\\0 \end{bmatrix} \end{pmatrix} = \begin{bmatrix} 3\\2 \end{bmatrix}$$

$$T(\mathbf{e}_2) = T\begin{pmatrix} \begin{bmatrix} 0\\1\\0 \end{bmatrix} \end{pmatrix} = \begin{bmatrix} -1\\4 \end{bmatrix}$$

$$T(\mathbf{e}_3) = T\begin{pmatrix} \begin{bmatrix} 0\\0\\1 \end{bmatrix} \end{pmatrix} = \begin{bmatrix} 5\\0 \end{bmatrix}$$

Then the standard matrix corresponding to T is

$$\begin{bmatrix} T(\mathbf{e}_1) & T(\mathbf{e}_2) & T(\mathbf{e}_3) \end{bmatrix} = \begin{bmatrix} 3 & -1 & 5 \\ 2 & 4 & 0 \end{bmatrix}.$$

TODO Let  $T: \mathbb{R}^3 \to \mathbb{R}^2$  be the linear transformation given by

$$T\left(\begin{bmatrix} x \\ y \\ z \end{bmatrix}\right) = \begin{bmatrix} x + 3z \\ 2x - y - 4z \end{bmatrix}$$

Write the matrix corresponding to this linear transformation with respect to the standard basis.

## Activity A.2.10 ( $\sim$ 5 min)

Let  $T:\mathbb{R}^3 \to \mathbb{R}^2$  be the linear transformation given by the standard matrix

$$\begin{bmatrix} 3 & -2 & -1 \\ 4 & 5 & 2 \end{bmatrix}.$$

Compute 
$$T \begin{pmatrix} x \\ y \\ z \end{pmatrix}$$
.

Section A.1 Section A.2 Section A.3 Section A.4

#### **Activity A.4.8** ( $\sim$ 5 min)

Let  $T: \mathbb{R}^n \to \mathbb{R}^m$  be a bijective linear map with standard matrix A. Label each of the following as true or false.

- (a) The columns of A form a basis for  $\mathbb{R}^m$
- (b) RREF(A) is the identity matrix.
- (c) The system of linear equations given by the augmented matrix  $\begin{bmatrix} A & \mathbf{b} \end{bmatrix}$  has exactly one solution for all  $\mathbf{b} \in \mathbb{R}^m$ .

Activity A.4.9 ( $\sim$ 10 min)

Let  $T: \mathbb{R}^2 \to \mathbb{R}^3$  be given by

$$T\left(\begin{bmatrix} x \\ y \end{bmatrix}\right) = \begin{bmatrix} 2x + 3y \\ x - y \\ x + 3y \end{bmatrix}.$$

- (a) T is neither injective nor surjective
- (b) T is injective but not surjective
- (c) T is surjective but not injective
- (d) T is bijective.

Activity A.4.10 ( $\sim$ 5 min)

Let  $T: \mathbb{R}^3 \to \mathbb{R}^2$  be given by

$$T\left(\begin{bmatrix} x \\ y \\ z \end{bmatrix}\right) = \begin{bmatrix} 2x + y - z \\ 4x + y + z \end{bmatrix}.$$

- (a) T is neither injective nor surjective
- (b) T is injective but not surjective
- (c) T is surjective but not injective
- (d) T is bijective.

# Activity A.4.11 ( $\sim$ 5 min)

Let  $T: \mathbb{R}^3 \to \mathbb{R}^3$  be given by

$$T\left(\begin{bmatrix} x \\ y \\ z \end{bmatrix}\right) = \begin{bmatrix} 2x + y - z \\ 4x + y + z \\ 6x + 2y + z \end{bmatrix}.$$

- (a) T is neither injective nor surjective
- (b) T is injective but not surjective
- (c) T is surjective but not injective
- (d) T is bijective.

Activity A.4.12 ( $\sim$ 5 min)

Let  $T: \mathbb{R}^3 \to \mathbb{R}^3$  be given by

$$T\left(\begin{bmatrix} x \\ y \\ z \end{bmatrix}\right) = \begin{bmatrix} 2x + y - z \\ 4x + y + z \\ 6x + 2y \end{bmatrix}.$$

- (a) T is neither injective nor surjective
- (b) T is injective but not surjective
- (c) T is surjective but not injective
- (d) T is bijective.
