Module P

Remark I.2
What is Linear Algebra?
Linear algebra is the study of **linear maps**.

- In Calculus, you learn how to approximate any function by a linear function.
- In Linear Algebra, we learn about how linear maps behave.
- Combining the two, we can approximate how any function behaves.

Linear Algebra

Module M

Module G

Module P

Remark I.3

What is Linear Algebra good for?

- Linear algebra is used throughout several fields in higher mathematics.

- In computer graphics, linear algebra is used to help represent 3D objects in a 2D grid of pixels.

- Linear algebra is used to approximate differential equation solutions in a vast number of engineering applications (e.g. fluid flows, vibrations, heat transfer) whose solutions are very difficult (or impossible) to find precisely.

- Google's search engine is based on its Page Rank algorithm, which ranks websites by computing an eigenvector of a matrix.

Module P

Remark 1.4
What will I learn in this class?

By the end of this class, you will be able to:

- Solve systems of linear equations. (Module E)
- Identify vector spaces and their properties. (Module V)
- Analyze the structure of vector spaces and sets of vectors. (Module S)
- Use and apply the algebraic properties of linear transformations. (Module A)
- Perform fundamental operations in the algebra of matrices. (Module M)
- Use and apply the geometric properties of linear transformations. (Module G)

Module E: Solving Systems of Linear Equations

Linear Algebra

Clontz &

Module A

Module M

Module G

Module P

How can we solve systems of linear equations?

Linear Algebra

Clontz &
Lewis

Module I
Module E
Module V
Module A
Module M
Module G
Module P

At the end of this module, students will be able to...

E1. Systems as matrices. ... translate back and forth between a system of linear equations and the corresponding augmented matrix.

E2. Row reduction. ... put a matrix in reduced row echelon form.

E3. Systems of linear equations. ... compute the solution set for a system of linear equations.

Readiness Assurance Outcomes

Before beginning this module, each student should be able to...

- Determine if a system to a two-variable system of linear equations will have zero, one, or infinitely-many solutions by graphing.

- Find the unique solution to a two-variable system of linear equations by back-substitution.

- Describe sets using set-builder notation, and check if an element is a member of a set described by set-builder notation.

Module I
Module E
Module V
Module A
Module M
Module G
Module P

Definition E.1

A **linear equation** is an equation of the variables x_i of the form

$$a_1 x_1 + a_2 x_2 + \cdots + a_n x_n = b.$$

A **solution** for a linear equation is a Euclidean vector

$$\begin{bmatrix} s_1 \\ s_2 \\ \vdots \\ s_n \end{bmatrix}$$

that satisfies

$$a_1 s_1 + a_2 s_2 + \cdots + a_n s_n = b$$

(that is, a Euclidean vector that can be plugged into the equation).

Linear Algebra

Clontz &
Lewis

Module I
Module E
Module V
Module A
Module M
Module G
Module P

Remark E.2

In previous classes you likely used the variables x, y, z in equations. However, since this course often deals with equations of four or more variables, we will often write our variables as x_i, and assume $x = x_1, y = x_2, z = x_3, w = x_4$ when convenient.

Linear Algebra

Clontz &
Lewis

Module I
Module E
Module V
Module A
Module M
Module G
Module P

Definition E.3

A **system of linear equations** (or a **linear system** for short) is a collection of one or more linear equations.

$$a_{11}x_1 + a_{12}x_2 + \ldots + a_{1n}x_n = b_1$$
$$a_{21}x_1 + a_{22}x_2 + \ldots + a_{2n}x_n = b_2$$
$$\vdots \qquad \vdots \qquad\qquad \vdots \qquad \vdots$$
$$a_{m1}x_1 + a_{m2}x_2 + \ldots + a_{mn}x_n = b_m$$

Its **solution set** is given by

$$\left\{ \begin{bmatrix} s_1 \\ s_2 \\ \vdots \\ s_n \end{bmatrix} \;\middle|\; \begin{bmatrix} s_1 \\ s_2 \\ \vdots \\ s_n \end{bmatrix} \text{ is a solution to all equations in the system} \right\}.$$

Module P

Remark E.4

When variables in a large linear system are missing, we prefer to write the system in one of the following standard forms:

Original linear system: Verbose standard form: Concise standard form:

$$
\begin{aligned}
x_1 + 3x_3 &= 3 \\
3x_1 - 2x_2 + 4x_3 &= 0 \\
-x_2 + x_3 &= -2
\end{aligned}
$$

$$
\begin{aligned}
1x_1 + 0x_2 + 3x_3 &= 3 \\
3x_1 - 2x_2 + 4x_3 &= 0 \\
0x_1 - 1x_2 + 1x_3 &= -2
\end{aligned}
$$

$$
\begin{aligned}
x_1 \quad\ + 3x_3 &= 3 \\
3x_1 - 2x_2 + 4x_3 &= 0 \\
-\ x_2 + \ x_3 &= -2
\end{aligned}
$$

Linear Algebra

Module M

Module G

Module P

Definition E.5

A linear system is **consistent** if its solution set is non-empty (that is, there exists a solution for the system). Otherwise it is **inconsistent**.

Linear Algebra

Clontz & Lewis

Module I

Module E

Module V

Module A

Module M

Module G

Module P

Fact E.6

All linear systems are one of the following:

- **Consistent with one solution**: its solution set contains a single vector, e.g.
  $$\left\{ \begin{bmatrix} 1 \\ 2 \\ 3 \end{bmatrix} \right\}$$

- **Consistent with infinitely-many solutions**: its solution set contains
  infinitely many vectors, e.g. $\left\{ \begin{bmatrix} 1 \\ 2 - 3a \\ a \end{bmatrix} \middle| a \in \mathbb{R} \right\}$

- **Inconsistent**: its solution set is the empty set $\{\} = \emptyset$

Clontz & Lewis

Module I

Module E

Module V

Module A

Module M

Module G

Module P

Observation E.10

Solving linear systems of two variables by graphing or substitution is reasonable for two-variable systems, but these simple techniques won't usually cut it for equations with more than two variables or more than two equations. For example,

$$
\begin{aligned}
-2x_1 - 4x_2 + x_3 - 4x_4 &= -8 \\
x_1 + 2x_2 + 2x_3 + 12x_4 &= -1 \\
x_1 + 2x_2 + x_3 + 8x_4 &= 1
\end{aligned}
$$

has the exact same solution set as the system in the previous activity, but we'll want to learn new techniques to compute these solutions efficiently.

Linear Algebra

Clontz &
Lewis

Module I
Module E
Module V
Module A
Module M
Module G
Module P

Remark E.11

The only important information in a linear system are its coefficients and constants.

Original linear system:

$$\begin{aligned} x_1 + 3x_3 &= 3 \\ 3x_1 - 2x_2 + 4x_3 &= 0 \\ -x_2 + x_3 &= -2 \end{aligned}$$

Verbose standard form:

$$\begin{aligned} 1x_1 + 0x_2 + 3x_3 &= 3 \\ 3x_1 - 2x_2 + 4x_3 &= 0 \\ 0x_1 - 1x_2 + 1x_3 &= -2 \end{aligned}$$

Coefficients/constants:

$$\begin{array}{ccc|c} 1 & 0 & 3 & 3 \\ 3 & -2 & 4 & 0 \\ 0 & -1 & 1 & -2 \end{array}$$

Linear Algebra

Module P

Definition E.12

A system of m linear equations with n variables is often represented by writing its coefficients and constants in an **augmented matrix**.

$$
\begin{aligned}
a_{11}x_1 + a_{12}x_2 + \ldots + a_{1n}x_n &= b_1 \\
a_{21}x_1 + a_{22}x_2 + \ldots + a_{2n}x_n &= b_2 \\
\vdots \qquad \vdots \qquad\qquad \vdots \qquad &\ \ \vdots \\
a_{m1}x_1 + a_{m2}x_2 + \ldots + a_{mn}x_n &= b_m
\end{aligned}
\qquad
\left[
\begin{array}{cccc|c}
a_{11} & a_{12} & \cdots & a_{1n} & b_1 \\
a_{21} & a_{22} & \cdots & a_{2n} & b_2 \\
\vdots & \vdots & \ddots & \vdots & \vdots \\
a_{m1} & a_{m2} & \cdots & a_{mn} & b_m
\end{array}
\right]
$$

Linear Algebra

Clontz &
Lewis

Module I
Module E
Module V
Module A
Module M
Module G
Module P

Example E.13

The corresponding augmented matrix for this system is obtained by simply writing the coefficients and constants in matrix form.

Linear system:

$$\begin{aligned} x_1 + 3x_3 &= 3 \\ 3x_1 - 2x_2 + 4x_3 &= 0 \\ -x_2 + x_3 &= -2 \end{aligned}$$

Augmented matrix:

$$\begin{bmatrix} 1 & 0 & 3 & 3 \\ 3 & -2 & 4 & 0 \\ 0 & -1 & 1 & -2 \end{bmatrix}$$

Linear Algebra

Clontz & Lewis

Module I
Module E
Module V
Module A
Module M
Module G
Module P

Definition E.14

Two systems of linear equations (and their corresponding augmented matrices) are said to be **equivalent** if they have the same solution set.

For example, both of these systems share the same solution set $\left\{ \begin{bmatrix} 1 \\ 1 \end{bmatrix} \right\}$.

$$3x_1 - 2x_2 = 1 \qquad\qquad\qquad 3x_1 - 2x_2 = 1$$
$$x_1 + 4x_2 = 5 \qquad\qquad\qquad 4x_1 + 2x_2 = 6$$

Therefore these augmented matrices are equivalent, which we denote with $\sim$:

$$\begin{bmatrix} 3 & -2 & 1 \\ 1 & 4 & 5 \end{bmatrix} \sim \begin{bmatrix} 3 & -2 & 1 \\ 4 & 2 & 6 \end{bmatrix}$$

Linear Algebra

Clontz & Lewis

Module I
Module E
Module V
Module A
Module M
Module G
Module P

Activity E.15 *(∼10 min)* Following are seven procedures used to manipulate an augmented matrix. Label the procedures that would result in an equivalent augmented matrix as **valid**, and label the procedures that might change the solution set of the corresponding linear system as **invalid**.

a) Swap two rows.

b) Swap two columns.

c) Add a constant to every term in a row.

d) Multiply a row by a nonzero constant.

e) Add a constant multiple of one row to another row.

f) Replace a column with zeros.

g) Replace a row with zeros.

Linear Algebra

Clontz &
Lewis

Module I
Module E
Module V
Module A
Module M
Module G
Module P

Definition E.16

The following **row operations** produce equivalent augmented matrices:

1 Swap two rows, for example, $R_1 \leftrightarrow R_2$:

$$\begin{bmatrix} 1 & 2 & | & 3 \\ 4 & 5 & | & 6 \end{bmatrix} \sim \begin{bmatrix} 4 & 5 & | & 6 \\ 1 & 2 & | & 3 \end{bmatrix}$$

2 Multiply a row by a nonzero constant, for example, $2R_1 \rightarrow R_1$:

$$\begin{bmatrix} 1 & 2 & | & 3 \\ 4 & 5 & | & 6 \end{bmatrix} \sim \begin{bmatrix} 2(1) & 2(2) & | & 2(3) \\ 4 & 5 & | & 6 \end{bmatrix}$$

3 Add a constant multiple of one row to another row, for example,
$R_2 - 4R_1 \rightarrow R_2$:

$$\begin{bmatrix} 1 & 2 & | & 3 \\ 4 & 5 & | & 6 \end{bmatrix} \sim \begin{bmatrix} 1 & 2 & | & 3 \\ 4 - 4(1) & 5 - 4(2) & | & 6 - 4(3) \end{bmatrix}$$

Whenever two matrices A, B are equivalent (so whenever we do any of these
operations), we write $A \sim B$.

Remark E.20
In practice, if we simply need to convert a matrix into reduced row echelon form, we use technology to do so.

However, it is also important to understand the **Gauss-Jordan elimination** algorithm that a computer or calculator uses to convert a matrix (augmented or not) into reduced row echelon form. Understanding this algorithm will help us better understand how to interpret the results in many applications we use it for in Module V.

Activity E.28 *(∼10 min)* Free browser-based technologies for mathematical computation are available online.

- Go to https://octave-online.net.
- Type A=sym([1 3 4 ; 2 5 7]) and press Enter to store the matrix $\begin{bmatrix} 1 & 3 & 2 \\ 2 & 5 & 7 \end{bmatrix}$ in the variable A.

    - The symbolic function sym is used to calculate precise answers rather than floating-point approximations.
    - The vertical bar in an augmented matrix does not affect row operations, so the RREF of $\begin{bmatrix} 1 & 3 & 2 \\ 2 & 5 & 7 \end{bmatrix}$ may be computed in the same way.

- Type rref(A) and press Enter to compute the reduced row echelon form of A.

Remark E.29

We will frequently need to know the reduced row echelon form of matrices during class, so feel free to use Octave-Online.net to compute RREF efficiently.

You may alternatively use the calculator you will use during assessments. Be sure to use fractions mode to compute exact solutions rather than floating-point approximations.

Definition E.34

Recall that the pivots of a matrix in RREF form are the leading 1s in each non-zero row.

The pivot columns in an augmented matrix correspond to the **bound variables** in the system of equations (x_1, x_3 below). The remaining variables are called **free variables** (x_2 below).

$$\left[\begin{array}{ccc|c} \textcircled{1} & 2 & 0 & 4 \\ 0 & 0 & \textcircled{1} & -1 \end{array}\right]$$

To efficiently solve a system in RREF form, assign letters to the free variables, and then solve for the bound variables.

Module P

At the end of this module, students will be able to...

V1. Vector spaces. ... explain why a given set with defined addition and scalar multiplication does satisfy a given vector space property, but nonetheless isn't a vector space.

V2. Linear combinations. ... determine if a Euclidean vector can be written as a linear combination of a given set of Euclidean vectors.

V3. Spanning sets. ... determine if a set of Euclidean vectors spans $\mathbb{R}^n$.

V4. Subspaces. ... determine if a subset of $\mathbb{R}^n$ is a subspace or not.

V5. Linear independence. ... determine if a set of Euclidean vectors is linearly dependent or independent.

V6. Basis verification. ... determine if a set of Euclidean vectors is a basis of $\mathbb{R}^n$.

V7. Basis computation. ... compute a basis for the subspace spanned by a given set of Euclidean vectors.

V8. Dimension. ... compute the dimension of a subspace of $\mathbb{R}^n$.

V9. Polynomial basis computation. ... compute a basis for the subspace spanned by a given set of polynomials or matrices.

V10. Basis of solution space. ... find a basis for the solution set of a homogeneous system of equations.

Readiness Assurance Outcomes

Before beginning this module, each student should be able to...

- Add Euclidean vectors and multiply Euclidean vectors by scalars.

- Add complex numbers and multiply complex numbers by scalars.

- Add polynomials and multiply polynomials by scalars.

- Perform basic manipulations of augmented matrices and linear systems **E1,E2,E3**.

Activity V.2 (~20 min) Consider each of the following properties of the real numbers $\mathbb{R}^1$. Label each property as **valid** if the property also holds for two-dimensional Euclidean vectors $\vec{u}, \vec{v}, \vec{w} \in \mathbb{R}^2$ and scalars $a, b \in \mathbb{R}$, and **invalid** if it does not.

① $\vec{u} + (\vec{v} + \vec{w}) = (\vec{u} + \vec{v}) + \vec{w}$.

② $\vec{u} + \vec{v} = \vec{v} + \vec{u}$.

③ There exists some $\vec{z}$ where $\vec{v} + \vec{z} = \vec{v}$.

④ There exists some $-\vec{v}$ where $\vec{v} + (-\vec{v}) = \vec{z}$.

⑤ If $\vec{u} \neq \vec{v}$, then $\frac{1}{2}(\vec{u} + \vec{v})$ is the only vector equally distant from both $\vec{u}$ and $\vec{v}$

⑥ $a(b\vec{v}) = (ab)\vec{v}$.

⑦ $1\vec{v} = \vec{v}$.

⑧ If $\vec{u} \neq \vec{0}$, then there exists some scalar c such that $c\vec{u} = \vec{v}$.

⑨ $a(\vec{u} + \vec{v}) = a\vec{u} + a\vec{v}$.

⑩ $(a + b)\vec{v} = a\vec{v} + b\vec{v}$.

Definition V.3

A **vector space** V is any collection of mathematical objects with associated addition $\oplus$ and scalar multiplication $\odot$ operations that satisfy the following properties. Let $\vec{u}, \vec{v}, \vec{w}$ belong to V, and let a, b be scalar numbers.

- **Addition is associative:**
  $\vec{u} \oplus (\vec{v} \oplus \vec{w}) = (\vec{u} \oplus \vec{v}) \oplus \vec{w}$.

- **Addition is commutative:**
  $\vec{u} \oplus \vec{v} = \vec{v} \oplus \vec{u}$.

- **Additive identity exists:** There exists some $\vec{z}$ where $\vec{v} \oplus \vec{z} = \vec{v}$.

- **Additive inverses exist:** There exists some $-\vec{v}$ where $\vec{v} \oplus (-\vec{v}) = \vec{z}$.

- **Scalar multiplication is associative:**
  $a \odot (b \odot \vec{v}) = (ab) \odot \vec{v}$.

- **Scalar multiplication identity exists:** $1 \odot \vec{v} = \vec{v}$.

- **Scalar mult. distributes over vector addition:**
  $a \odot (\vec{u} \oplus \vec{v}) = a \odot \vec{u} \oplus a \odot \vec{v}$.

- **Scalar mult. distributes over scalar addition:**
  $(a + b) \odot \vec{v} = a \odot \vec{v} \oplus b \odot \vec{v}$.

Remark V.6

Previously, we defined a **vector space** V to be any collection of mathematical objects with associated addition and scalar multiplication operations that satisfy the following eight properties for all $\vec{u}, \vec{v}, \vec{w}$ in V, and all scalars (i.e. real numbers) a, b.

- **Addition is associative:**
  $\vec{u} \oplus (\vec{v} \oplus \vec{w}) = (\vec{u} \oplus \vec{v}) \oplus \vec{w}$.

- **Addition is commutative:**
  $\vec{u} \oplus \vec{v} = \vec{v} \oplus \vec{u}$.

- **Additive identity exists:** There exists some $\vec{z}$ where $\vec{v} \oplus \vec{z} = \vec{v}$.

- **Additive inverses exist:** There exists some $-\vec{v}$ where $\vec{v} \oplus (-\vec{v}) = \vec{z}$.

- **Scalar multiplication is associative:**
  $a \odot (b \odot \vec{v}) = (ab) \odot \vec{v}$.

- **Scalar multiplication identity exists:** $1 \odot \vec{v} = \vec{v}$.

- **Scalar mult. distributes over vector addition:**
  $a \odot (\vec{u} \oplus \vec{v}) = a \odot \vec{u} \oplus a \odot \vec{v}$.

- **Scalar mult. distributes over scalar addition:**
  $(a + b) \odot \vec{v} = a \odot \vec{v} \oplus b \odot \vec{v}$.

Remark V.7

Every Euclidean space $\mathbb{R}^n$ is a vector space, but there are other examples of vector spaces as well.

For example, consider the set $\mathbb{C}$ of complex numbers with the usual defintions of addition and scalar multiplication, and let $\vec{\mathbf{u}} = a + b\mathbf{i}$, $\vec{\mathbf{v}} = c + d\mathbf{i}$, and $\vec{\mathbf{w}} = e + f\mathbf{i}$. Then

$$\begin{aligned}
\vec{\mathbf{u}} + (\vec{\mathbf{v}} + \vec{\mathbf{w}}) &= (a + b\mathbf{i}) + ((c + d\mathbf{i}) + (e + f\mathbf{i})) \\
&= (a + b\mathbf{i}) + ((c + e) + (d + f)\mathbf{i}) \\
&= (a + c + e) + (b + d + f)\mathbf{i} \\
&= ((a + c) + (b + d)\mathbf{i}) + (e + f\mathbf{i}) \\
&= (\vec{\mathbf{u}} + \vec{\mathbf{v}}) + \vec{\mathbf{w}}
\end{aligned}$$

All eight properties can be verified in this way.

Remark V.10

It turns out $V = \{(x, y) \mid y = e^x\}$ with operations defined by

$$(x, y) \oplus (z, w) = (x + z, yw) \qquad c \odot (x, y) = (cx, y^c)$$

satisifes all eight properties.

- **Addition is associative:**
  $\vec{\mathbf{u}} \oplus (\vec{\mathbf{v}} \oplus \vec{\mathbf{w}}) = (\vec{\mathbf{u}} \oplus \vec{\mathbf{v}}) \oplus \vec{\mathbf{w}}$.

- **Addition is commutative:**
  $\vec{\mathbf{u}} \oplus \vec{\mathbf{v}} = \vec{\mathbf{v}} \oplus \vec{\mathbf{u}}$.

- **Additive identity exists:** There
  exists some $\vec{\mathbf{z}}$ where $\vec{\mathbf{v}} \oplus \vec{\mathbf{z}} = \vec{\mathbf{v}}$.

- **Additive inverses exist:** There
  exists some $-\vec{\mathbf{v}}$ where
  $\vec{\mathbf{v}} \oplus (-\vec{\mathbf{v}}) = \vec{\mathbf{z}}$.

- **Scalar multiplication is
  associative:**
  $a \odot (b \odot \vec{\mathbf{v}}) = (ab) \odot \vec{\mathbf{v}}$.

- **Scalar multiplication identity
  exists:** $1 \odot \vec{\mathbf{v}} = \vec{\mathbf{v}}$.

- **Scalar mult. distributes over
  vector addition:**
  $a \odot (\vec{\mathbf{u}} \oplus \vec{\mathbf{v}}) = a \odot \vec{\mathbf{u}} \oplus a \odot \vec{\mathbf{v}}$.

- **Scalar mult. distributes over
  scalar addition:**
  $(a + b) \odot \vec{\mathbf{v}} = a \odot \vec{\mathbf{v}} \oplus b \odot \vec{\mathbf{v}}$.

Thus, V is a vector space.

Definition V.12

A **linear combination** of a set of vectors $\{\vec{\mathbf{v}}_1, \vec{\mathbf{v}}_2, \ldots, \vec{\mathbf{v}}_m\}$ is given by $c_1\vec{\mathbf{v}}_1 + c_2\vec{\mathbf{v}}_2 + \cdots + c_m\vec{\mathbf{v}}_m$ for any choice of scalar multiples $c_1, c_2, \ldots, c_m$.

For example, we can say $\begin{bmatrix} 3 \\ 0 \\ 5 \end{bmatrix}$ is a linear combination of the vectors $\begin{bmatrix} 1 \\ -1 \\ 2 \end{bmatrix}$ and $\begin{bmatrix} 1 \\ 2 \\ 1 \end{bmatrix}$ since

$$\begin{bmatrix} 3 \\ 0 \\ 5 \end{bmatrix} = 2 \begin{bmatrix} 1 \\ -1 \\ 2 \end{bmatrix} + 1 \begin{bmatrix} 1 \\ 2 \\ 1 \end{bmatrix}$$

Definition V.13

The **span** of a set of vectors is the collection of all linear combinations of that set:

$$\text{span}\{\vec{\mathbf{v}}_1, \vec{\mathbf{v}}_2, \ldots, \vec{\mathbf{v}}_m\} = \{c_1\vec{\mathbf{v}}_1 + c_2\vec{\mathbf{v}}_2 + \cdots + c_m\vec{\mathbf{v}}_m \mid c_i \in \mathbb{R}\}.$$

For example:

$$\text{span}\left\{\begin{bmatrix} 1 \\ -1 \\ 2 \end{bmatrix}, \begin{bmatrix} 1 \\ 2 \\ 1 \end{bmatrix}\right\} = \left\{ a\begin{bmatrix} 1 \\ -1 \\ 2 \end{bmatrix} + b\begin{bmatrix} 1 \\ 2 \\ 1 \end{bmatrix} \middle| a, b \in \mathbb{R} \right\}$$

Remark V.17

Recall these definitions from last class:

- A **linear combination** of vectors is given by adding scalar multiples of those vectors, such as:

$$\begin{bmatrix} 3 \\ 0 \\ 5 \end{bmatrix} = 2 \begin{bmatrix} 1 \\ -1 \\ 2 \end{bmatrix} + 1 \begin{bmatrix} 1 \\ 2 \\ 1 \end{bmatrix}$$

- The **span** of a set of vectors is the collection of all linear combinations of that set, such as:

$$\text{span} \left\{ \begin{bmatrix} 1 \\ -1 \\ 2 \end{bmatrix}, \begin{bmatrix} 1 \\ 2 \\ 1 \end{bmatrix} \right\} = \left\{ a \begin{bmatrix} 1 \\ -1 \\ 2 \end{bmatrix} + b \begin{bmatrix} 1 \\ 2 \\ 1 \end{bmatrix} \, \middle| \, a, b \in \mathbb{R} \right\}$$

Fact V.36

Any subset S of a vector space V that contains the additive identity $\vec{\mathbf{0}}$ satisfies the eight vector space properties automatically, since it is a collection of known vectors.

However, to verify that it's a sub**space**, we need to check that addition and multiplication still make sense using only vectors from S. So we need to check two things:

- The set is **closed under addition**: for any $\vec{\mathbf{x}}, \vec{\mathbf{y}} \in S$, the sum $\vec{\mathbf{x}} + \vec{\mathbf{y}}$ is also in S.
- The set is **closed under scalar multiplication**: for any $\vec{\mathbf{x}} \in S$ and scalar $c \in \mathbb{R}$, the product $c\vec{\mathbf{x}}$ is also in S.

Remark V.39

Since 0 is a scalar and $0\vec{v} = \vec{z}$ for any vector $\vec{v}$, a nonempty set that is closed under scalar multiplication must contain the zero vector $\vec{z}$ for that vector space.

Put another way, you can check any of the following to show that a nonempty subset W isn't a subspace:

- Show that $\vec{0} \notin W$.
- Find $\vec{u}, \vec{v} \in W$ such that $\vec{u} + \vec{v} \notin W$.
- Find $c \in \mathbb{R}, \vec{v} \in W$ such that $c\vec{v} \notin W$.

If you cannot do any of these, then W can be proven to be a subspace by doing the following:

- Prove that $\vec{u} + \vec{v} \in W$ whenever $\vec{u}, \vec{v} \in W$.
- Prove that $c\vec{v} \in W$ whenever $c \in \mathbb{R}, \vec{v} \in W$.

Definition V.44

We say that a set of vectors is **linearly dependent** if one vector in the set belongs to the span of the others. Otherwise, we say the set is **linearly independent**.
You can think of linearly dependent sets as containing a redundant vector, in the sense that you can drop a vector out without reducing the span of the set. In the above image, all three vectors lay on the same planar subspace, but only two vectors are needed to span the plane, so the set is linearly dependent.

Definition V.55

A **basis** is a linearly independent set that spans a vector space.

The **standard basis** of $\mathbb{R}^n$ is the set $\{\vec{\mathbf{e}}_1, \ldots, \vec{\mathbf{e}}_n\}$ where

$$\vec{\mathbf{e}}_1 = \begin{bmatrix} 1 \\ 0 \\ 0 \\ \vdots \\ 0 \\ 0 \end{bmatrix} \qquad \vec{\mathbf{e}}_2 = \begin{bmatrix} 0 \\ 1 \\ 0 \\ \vdots \\ 0 \\ 0 \end{bmatrix} \qquad \cdots \qquad \vec{\mathbf{e}}_n = \begin{bmatrix} 0 \\ 0 \\ 0 \\ \vdots \\ 0 \\ 1 \end{bmatrix}$$

For $\mathbb{R}^3$, these are the vectors $\vec{\mathbf{e}}_1 = \hat{\imath} = \begin{bmatrix} 1 \\ 0 \\ 0 \end{bmatrix}$, $\vec{\mathbf{e}}_2 = \hat{\jmath} = \begin{bmatrix} 0 \\ 1 \\ 0 \end{bmatrix}$, and $\vec{\mathbf{e}}_3 = \hat{k} = \begin{bmatrix} 0 \\ 0 \\ 1 \end{bmatrix}$.

Linear Algebra

Clontz &
Lewis

Module I
Module E
Module V
Module A
Module M
Module G
Module P

Observation V.56

A basis may be thought of as a collection of building blocks for a vector space, since every vector in the space can be expressed as a unique linear combination of basis vectors.

For example, in many calculus courses, vectors in $\mathbb{R}^3$ are often expressed in their component form

$$(3, -2, 4) = \begin{bmatrix} 3 \\ -2 \\ 4 \end{bmatrix}$$

or in their standard basic vector form

$$3\vec{\mathbf{e}}_1 - 2\vec{\mathbf{e}}_2 + 4\vec{\mathbf{e}}_3 = 3\hat{\imath} - 2\hat{\jmath} + 4\hat{k}.$$

Since every vector in $\mathbb{R}^3$ can be uniquely described as a linear combination of the vectors in $\{\vec{\mathbf{e}}_1, \vec{\mathbf{e}}_2, \vec{\mathbf{e}}_3\}$, this set is indeed a basis.

Fact V.68

Any non-trivial vector space has infinitely-many different bases, but all the bases for a given vector space are exactly the same size.

For example,

$$\{\vec{e}_1, \vec{e}_2, \vec{e}_3\} \text{ and } \left\{ \begin{bmatrix} 1 \\ 0 \\ 0 \end{bmatrix}, \begin{bmatrix} 0 \\ 1 \\ 0 \end{bmatrix}, \begin{bmatrix} 1 \\ 1 \\ 1 \end{bmatrix} \right\} \text{ and } \left\{ \begin{bmatrix} 1 \\ 0 \\ -3 \end{bmatrix}, \begin{bmatrix} 2 \\ -2 \\ 1 \end{bmatrix}, \begin{bmatrix} 3 \\ -2 \\ 5 \end{bmatrix} \right\}$$

are all valid bases for $\mathbb{R}^3$, and they all contain three vectors.

Definition V.69

The **dimension** of a vector space is equal to the size of any basis for the vector space.

As you'd expect, $\mathbb{R}^n$ has dimension n. For example, $\mathbb{R}^3$ has dimension 3 because any basis for $\mathbb{R}^3$ such as

$$\{\vec{\mathbf{e}}_1, \vec{\mathbf{e}}_2, \vec{\mathbf{e}}_3\} \text{ and } \left\{ \begin{bmatrix} 1 \\ 0 \\ 0 \end{bmatrix}, \begin{bmatrix} 0 \\ 1 \\ 0 \end{bmatrix}, \begin{bmatrix} 1 \\ 1 \\ 1 \end{bmatrix} \right\} \text{ and } \left\{ \begin{bmatrix} 1 \\ 0 \\ -3 \end{bmatrix}, \begin{bmatrix} 2 \\ -2 \\ 1 \end{bmatrix}, \begin{bmatrix} 3 \\ -2 \\ 5 \end{bmatrix} \right\}$$

contains exactly three vectors.

Observation V.75

The space of polynomials $\mathcal{P}$ (of *any* degree) has the basis $\{1, x, x^2, x^3, \dots\}$, so it is a natural example of an infinite-dimensional vector space.

Since $\mathcal{P}$ and other infinite-dimensional spaces cannot be treated as an isomorphic finite-dimensional Euclidean space $\mathbb{R}^n$, vectors in such spaces cannot be studied by converting them into Euclidean vectors. Fortunately, most of the examples we will be interested in for this course will be finite-dimensional.

Definition V.76

A **homogeneous** system of linear equations is one of the form:

$$a_{11}x_1 + a_{12}x_2 + \ldots + a_{1n}x_n = 0$$
$$a_{21}x_1 + a_{22}x_2 + \ldots + a_{2n}x_n = 0$$
$$\vdots \qquad \vdots \qquad\qquad \vdots \quad \vdots$$
$$a_{m1}x_1 + a_{m2}x_2 + \ldots + a_{mn}x_n = 0$$

This system is equivalent to the vector equation:

$$x_1\vec{\mathbf{v}}_1 + \cdots + x_n\vec{\mathbf{v}}_n = \vec{\mathbf{0}}$$

and the augmented matrix:

$$\begin{bmatrix} a_{11} & a_{12} & \cdots & a_{1n} & 0 \\ a_{21} & a_{22} & \cdots & a_{2n} & 0 \\ \vdots & \vdots & \ddots & \vdots & \vdots \\ a_{m1} & a_{m2} & \cdots & a_{mn} & 0 \end{bmatrix}$$

Linear Algebra

Module I
Module E
Module V
Module A
Module M
Module G
Module P

Activity V.77 ($\sim$5 min) Note that if $\begin{bmatrix} a_1 \\ \vdots \\ a_n \end{bmatrix}$ and $\begin{bmatrix} b_1 \\ \vdots \\ b_n \end{bmatrix}$ are solutions to

$x_1\vec{\mathbf{v}}_1 + \cdots + x_n\vec{\mathbf{v}}_n = \vec{\mathbf{0}}$ so is $\begin{bmatrix} a_1 + b_1 \\ \vdots \\ a_n + b_n \end{bmatrix}$, since

$$a_1\vec{\mathbf{v}}_1 + \cdots + a_n\vec{\mathbf{v}}_n = \vec{\mathbf{0}} \text{ and } b_1\vec{\mathbf{v}}_1 + \cdots + b_n\vec{\mathbf{v}}_n = \vec{\mathbf{0}}$$

implies

$$(a_1 + b_1)\vec{\mathbf{v}}_1 + \cdots + (a_n + b_n)\vec{\mathbf{v}}_n = \vec{\mathbf{0}}.$$

Similarly, if $c \in \mathbb{R}$, $\begin{bmatrix} ca_1 \\ \vdots \\ ca_n \end{bmatrix}$ is a solution. Thus the solution set of a homogeneous

system is...

a) A basis for $\mathbb{R}^n$.   b) A subspace of $\mathbb{R}^n$.   c) The empty set.

Module I
Module E
Module V
Module A
Module M
Module G
Module P

Definition A.1

A **linear transformation** (also known as a **linear map**) is a map between vector spaces that preserves the vector space operations. More precisely, if V and W are vector spaces, a map $T : V \to W$ is called a linear transformation if

1. $T(\vec{\mathbf{v}} + \vec{\mathbf{w}}) = T(\vec{\mathbf{v}}) + T(\vec{\mathbf{w}})$ for any $\vec{\mathbf{v}}, \vec{\mathbf{w}} \in V$.
2. $T(c\vec{\mathbf{v}}) = cT(\vec{\mathbf{v}})$ for any $c \in \mathbb{R}, \vec{\mathbf{v}} \in V$.

In other words, a map is linear when vector space operations can be applied before or after the transformation without affecting the result.

Linear Algebra

Clontz & Lewis

Module I
Module E
Module V
Module A
Module M
Module G
Module P

Definition A.2
Given a linear transformation $T : V \rightarrow W$, V is called the **domain** of T and W is called the **co-domain** of T.

Linear transformation $T : \mathbb{R}^3 \rightarrow \mathbb{R}^2$

domain $\mathbb{R}^3$ co-domain $\mathbb{R}^2$

Linear Algebra

Clontz &
Lewis

Module I
Module E
Module V
Module A
Module M
Module G
Module P
Example A.3

Let $T : \mathbb{R}^3 \rightarrow \mathbb{R}^2$ be given by

$$T \left(\begin{bmatrix} x \\ y \\ z \end{bmatrix} \right) = \begin{bmatrix} x - z \\ 3y \end{bmatrix}$$

To show that T is linear, we must verify...

$$T \left(\begin{bmatrix} x \\ y \\ z \end{bmatrix} + \begin{bmatrix} u \\ v \\ w \end{bmatrix} \right) = T \left(\begin{bmatrix} x + u \\ y + v \\ z + w \end{bmatrix} \right) = \begin{bmatrix} (x + u) - (z + w) \\ 3(y + v) \end{bmatrix}$$

$$T \left(\begin{bmatrix} x \\ y \\ z \end{bmatrix} \right) + T \left(\begin{bmatrix} u \\ v \\ w \end{bmatrix} \right) = \begin{bmatrix} x - z \\ 3y \end{bmatrix} + \begin{bmatrix} u - w \\ 3v \end{bmatrix} = \begin{bmatrix} (x + u) - (z + w) \\ 3(y + v) \end{bmatrix}$$

And also...

$$T \left(c \begin{bmatrix} x \\ y \\ z \end{bmatrix} \right) = T \left(\begin{bmatrix} cx \\ cy \\ cz \end{bmatrix} \right) = \begin{bmatrix} cx - cz \\ 3cy \end{bmatrix} \text{ and } cT \left(\begin{bmatrix} x \\ y \\ z \end{bmatrix} \right) = c \begin{bmatrix} x - z \\ 3y \end{bmatrix} = \begin{bmatrix} cx - cz \\ 3cy \end{bmatrix}$$

Therefore T is a linear transformation.

Linear Algebra

Clontz &
Lewis

Module I
Module E
Module V
Module A
Module M
Module G
Module P

Example A.4

Let $T : \mathbb{R}^2 \to \mathbb{R}^4$ be given by

$$T\left(\begin{bmatrix} x \\ y \end{bmatrix}\right) = \begin{bmatrix} x + y \\ x^2 \\ y + 3 \\ y - 2^x \end{bmatrix}$$

To show that T is not linear, we only need to find one counterexample.

$$T\left(\begin{bmatrix} 0 \\ 1 \end{bmatrix} + \begin{bmatrix} 2 \\ 3 \end{bmatrix}\right) = T\left(\begin{bmatrix} 2 \\ 4 \end{bmatrix}\right) = \begin{bmatrix} 6 \\ 4 \\ 7 \\ 0 \end{bmatrix}$$

$$T\left(\begin{bmatrix} 0 \\ 1 \end{bmatrix}\right) + T\left(\begin{bmatrix} 2 \\ 3 \end{bmatrix}\right) = \begin{bmatrix} 1 \\ 0 \\ 4 \\ -1 \end{bmatrix} + \begin{bmatrix} 5 \\ 4 \\ 6 \\ -5 \end{bmatrix} = \begin{bmatrix} 6 \\ 4 \\ 10 \\ -6 \end{bmatrix}$$

Since the resulting vectors are different, T is not a linear transformation.

Linear Algebra

Clontz & Lewis

Module I
Module E
Module V
Module A
Module M
Module G
Module P

Fact A.5

A map between Euclidean spaces $T : \mathbb{R}^n \to \mathbb{R}^m$ is linear exactly when every component of the output is a linear combination of the variables of $\mathbb{R}^n$.

For example, the following map is definitely linear because $x - z$ and $3y$ are linear combinations of x, y, z:

$$T\left(\begin{bmatrix} x \\ y \\ z \end{bmatrix}\right) = \begin{bmatrix} x - z \\ 3y \end{bmatrix} = \begin{bmatrix} 1x + 0y - 1z \\ 0x + 3y + 0z \end{bmatrix}$$

But this map is not linear because x^2, $y + 3$, and $y - 2^x$ are not linear combinations (even though $x + y$ is):

$$T\left(\begin{bmatrix} x \\ y \end{bmatrix}\right) = \begin{bmatrix} x + y \\ x^2 \\ y + 3 \\ y - 2^x \end{bmatrix}$$

Fact A.8

If $L : V \to W$ is linear, then $L(\vec{z}) = L(0\vec{v}) = 0L(\vec{v}) = \vec{z}$ where $\vec{z}$ is the additive identity of the vector spaces V, W.

Put another way, an easy way to prove that a map like $T(f(x)) = f'(x) + x^3$ can't be linear is because

$$T(0) = \frac{d}{dx}[0] + x^3 = 0 + x^3 = x^3 \neq 0.$$

Linear Algebra

Clontz & Lewis

Module I
Module E
Module V
Module A
Module M
Module G
Module P

Observation A.9

Showing $L : V \to W$ is not a linear transformation can be done by finding an example for any one of the following.

- Show $L(\vec{z}) \neq \vec{z}$ (where $\vec{z}$ is the additive identity of L and W).
- Find $\vec{v}, \vec{w} \in V$ such that $L(\vec{v} + \vec{w}) \neq L(\vec{v}) + L(\vec{w})$.
- Find $\vec{v} \in V$ and $c \in \mathbb{R}$ such that $L(c\vec{v}) \neq cL(\vec{v})$.

Otherwise, L can be shown to be linear by proving the following in general.

- For all $\vec{v}, \vec{w} \in V$, $L(\vec{v} + \vec{w}) = L(\vec{v}) + L(\vec{w})$.
- For all $\vec{v} \in V$ and $c \in \mathbb{R}$, $L(c\vec{v}) = cL(\vec{v})$.

Note the similarities between this process and showing that a subset of a vector space is/isn't a subspace.

Remark A.12

Recall that a linear map $T : V \to W$ satisfies

1. $T(\vec{\mathbf{v}} + \vec{\mathbf{w}}) = T(\vec{\mathbf{v}}) + T(\vec{\mathbf{w}})$ for any $\vec{\mathbf{v}}, \vec{\mathbf{w}} \in V$.

2. $T(c\vec{\mathbf{v}}) = cT(\vec{\mathbf{v}})$ for any $c \in \mathbb{R}, \vec{\mathbf{v}} \in V$.

In other words, a map is linear when vector space operations can be applied before or after the transformation without affecting the result.

Fact A.17

Consider any basis $\{\vec{\mathbf{b}}_1, \ldots, \vec{\mathbf{b}}_n\}$ for V. Since every vector $\vec{\mathbf{v}}$ can be written as a linear combination of basis vectors, $x_1\vec{\mathbf{b}}_1 + \cdots + x_n\vec{\mathbf{b}}_n$, we may compute $T(\vec{\mathbf{v}})$ as follows:

$$T(\vec{\mathbf{v}}) = T(x_1\vec{\mathbf{b}}_1 + \cdots + x_n\vec{\mathbf{b}}_n) = x_1 T(\vec{\mathbf{b}}_1) + \cdots + x_n T(\vec{\mathbf{b}}_n).$$

Therefore any linear transformation $T : V \to W$ can be defined by just describing the values of $T(\vec{\mathbf{b}}_i)$.

Put another way, the images of the basis vectors **determine** the transformation T.

Module M
Module G
Module P

Definition A.18

Since linear transformation $T : \mathbb{R}^n \to \mathbb{R}^m$ is determined by the standard basis $\{\vec{\mathbf{e}}_1, \ldots, \vec{\mathbf{e}}_n\}$, it's convenient to store this information in the $m \times n$ **standard matrix** $[T(\vec{\mathbf{e}}_1) \cdots T(\vec{\mathbf{e}}_n)]$.

For example, let $T : \mathbb{R}^3 \to \mathbb{R}^2$ be the linear map determined by the following values for T applied to the standard basis of $\mathbb{R}^3$.

$$T\left(\vec{\mathbf{e}}_1\right) = T\left(\begin{bmatrix} 1 \\ 0 \\ 0 \end{bmatrix}\right) = \begin{bmatrix} 3 \\ 2 \end{bmatrix} \qquad T\left(\vec{\mathbf{e}}_2\right) = T\left(\begin{bmatrix} 0 \\ 1 \\ 0 \end{bmatrix}\right) = \begin{bmatrix} -1 \\ 4 \end{bmatrix} \qquad T\left(\vec{\mathbf{e}}_3\right) = T\left(\begin{bmatrix} 0 \\ 0 \\ 1 \end{bmatrix}\right) = \begin{bmatrix} 5 \\ 0 \end{bmatrix}$$

Then the standard matrix corresponding to T is

$$\begin{bmatrix} T(\vec{\mathbf{e}}_1) & T(\vec{\mathbf{e}}_2) & T(\vec{\mathbf{e}}_3) \end{bmatrix} = \begin{bmatrix} 3 & -1 & 5 \\ 2 & 4 & 0 \end{bmatrix}.$$

Fact A.21

Because every linear map $T : \mathbb{R}^m \to \mathbb{R}^n$ has a linear combination of the variables in each component, and thus $T(\vec{\mathbf{e}}_i)$ yields exactly the coefficients of x_i, the standard matrix for T is simply an ordered list of the coefficients of the x_i:

$$T\left(\begin{bmatrix} x \\ y \\ z \\ w \end{bmatrix}\right) = \begin{bmatrix} ax + by + cz + dw \\ ex + fy + gz + hw \end{bmatrix} \qquad A = \begin{bmatrix} a & b & c & d \\ e & f & g & h \end{bmatrix}$$

Definition A.40

Let $T : V \to W$ be a linear transformation. T is called **surjective** or **onto** if every element of W is mapped to by an element of V. More precisely, for every $\vec{w} \in W$, there is some $\vec{v} \in V$ with $T(\vec{v}) = \vec{w}$.
surjective

not surjective

Activity A.41 ($\sim$3 min) Let $T : \mathbb{R}^2 \to \mathbb{R}^3$ be given by

$$T \left(\begin{bmatrix} x \\ y \end{bmatrix} \right) = \begin{bmatrix} x \\ y \\ 0 \end{bmatrix} \qquad \text{with standard matrix } \begin{bmatrix} 1 & 0 \\ 0 & 1 \\ 0 & 0 \end{bmatrix}$$

Is T surjective?

a) Yes, because for every $\vec{\mathbf{w}} = \begin{bmatrix} x \\ y \\ z \end{bmatrix} \in \mathbb{R}^3$, there exists $\vec{\mathbf{v}} = \begin{bmatrix} x \\ y \end{bmatrix} \in \mathbb{R}^2$ such that $T(\vec{\mathbf{v}}) = \vec{\mathbf{w}}$.

b) No, because $T \left(\begin{bmatrix} x \\ y \end{bmatrix} \right)$ can never equal $\begin{bmatrix} 1 \\ 1 \\ 1 \end{bmatrix}$.

c) No, because $T \left(\begin{bmatrix} x \\ y \end{bmatrix} \right)$ can never equal $\begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$.

Observation A.44

Let $T : V \to W$. We have previously defined the following terms.

- The **kernel** of T is the set of all vectors in V that are mapped to $\vec{z} \in W$. It is a subspace of V.

- The **image** of T is the set of all vectors in W that are mapped to by something in V. It is a subspace of W.

- T is called **injective** or **one-to-one** if T always maps distinct vectors to different places.

- T is called **surjective** or **onto** if every element of W is mapped to by some element of V.

Fact A.53

The following are true for any linear map $T : V \to W$:

- If $\dim(V) > \dim(W)$, then T is not injective.
- If $\dim(V) < \dim(W)$, then T is not surjective.

Basically, a linear transformation cannot reduce dimension without collapsing vectors into each other, and a linear transformation cannot increase dimension from its domain to its image.

not injective, 3 > 2   not surjective, 2 < 3

But dimension arguments **cannot** be used to prove a map **is** injective or surjective.

Readiness Assurance Outcomes

Before beginning this module, each student should be able to...

- Compose functions of real numbers.

- Identify the domain and codomain of linear transformations.

- Find the matrix corresponding to a linear transformation and compute the image of a vector given a standard matrix **A2**

- Determine if a linear transformation is injective and/or surjective **A4**

- Interpret the ideas of injectivity and surjectivity in multiple ways.

Definition M.5

We define the **product** AB of a $m \times n$ matrix A and a $n \times k$ matrix B to be the $m \times k$ standard matrix of the composition map of the two corresponding linear functions.

For the previous activity, S had a $4 \times \boxed{2}$ matrix and T had a $\boxed{2} \times 3$ matrix, so $S \circ T$ had a 4×3 standard matrix:

$$
AB = \begin{bmatrix} 1 & 2 \\ 0 & 1 \\ 3 & 5 \\ -1 & -2 \end{bmatrix} \begin{bmatrix} 2 & 1 & -3 \\ 5 & -3 & 4 \end{bmatrix}
$$

$$
= [(S \circ T)(\vec{e_1}) \quad (S \circ T)(\vec{e_2}) \quad (S \circ T)(\vec{e_3})] = \begin{bmatrix} 12 & -5 & 5 \\ 5 & -3 & 4 \\ 31 & -12 & 11 \\ -12 & 5 & -5 \end{bmatrix}.

Remark M.8

Recall that the **product** AB of a $m \times n$ matrix A and an $n \times k$ matrix B is the $m \times k$ standard matrix of the composition map of the two corresponding linear functions.

For example, if S has a $4 \times \boxed{2}$ matrix A and T has a $\boxed{2} \times 3$ matrix B, then $S \circ T$ has a 4×3 standard matrix:

$$AB = \begin{bmatrix} 1 & 2 \\ 0 & 1 \\ 3 & 5 \\ -1 & -2 \end{bmatrix} \begin{bmatrix} 2 & 1 & -3 \\ 5 & -3 & 4 \end{bmatrix}$$

$$= [(S \circ T)(\vec{\mathbf{e}}_1) \quad (S \circ T)(\vec{\mathbf{e}}_2) \quad (S \circ T)(\vec{\mathbf{e}}_3)] = \begin{bmatrix} 12 & -5 & 5 \\ 5 & -3 & 4 \\ 31 & -12 & 11 \\ -12 & 5 & -5 \end{bmatrix}.$$

Fact M.14

If R is the result of applying a row operation to I, then RA is the result of applying the same row operation to A.

- Scaling a row: $R = \begin{bmatrix} c & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}$

- Swapping rows: $R = \begin{bmatrix} 0 & 1 & 0 \\ 1 & 0 & 0 \\ 0 & 0 & 1 \end{bmatrix}$

- Adding a row multiple to another row: $R = \begin{bmatrix} 1 & 0 & c \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}$

Such matrices can be chained together to emulate multiple row operations. In particular,

$$\text{RREF}(A) = R_k \ldots R_2 R_1 A$$

for some sequence of matrices $R_1, R_2, \ldots, R_k$.

Definition M.17

Let $T : \mathbb{R}^n \to \mathbb{R}^n$ be a linear map with standard matrix A.

- If T is a bijection and $\vec{\mathbf{b}}$ is any $\mathbb{R}^n$ vector, then $T(\vec{\mathbf{x}}) = A\vec{\mathbf{x}} = \vec{\mathbf{b}}$ has a unique solution.

- So we may define an **inverse map** $T^{-1} : \mathbb{R}^n \to \mathbb{R}^n$ by setting $T^{-1}(\vec{\mathbf{b}})$ to be this unique solution.

- Let A^{-1} be the standard matrix for T^{-1}. We call A^{-1} the **inverse matrix** of A, so we also say that A is **invertible**.

Readiness Assurance Outcomes

Before beginning this module, each student should be able to...

- Calculate the area of a parallelogram.
- Find the matrix corresponding to a linear transformation of Euclidean spaces **A2**.
- Recall and use the definition of a linear transformation **A1**.
- Find all roots of quadratic polynomials (including complex ones).
- Interpret the statement "A is an invertible matrix" in many equivalent ways in different contexts.

It is possible to find two nonparallel vectors that are scaled but not rotated by the linear map given by B.

$$B\vec{\mathbf{e}}_1 = \begin{bmatrix} 2 & 3 \\ 0 & 4 \end{bmatrix} \begin{bmatrix} 1 \\ 0 \end{bmatrix} = \begin{bmatrix} 2 \\ 0 \end{bmatrix} = 2\vec{\mathbf{e}}_1$$

$$B \begin{bmatrix} \frac{3}{4} \\ \frac{1}{2} \end{bmatrix} = \begin{bmatrix} 2 & 3 \\ 0 & 4 \end{bmatrix} \begin{bmatrix} \frac{3}{4} \\ \frac{1}{2} \end{bmatrix} = \begin{bmatrix} 3 \\ 2 \end{bmatrix} = 4 \begin{bmatrix} \frac{3}{4} \\ \frac{1}{2} \end{bmatrix}$$
The process for finding such vectors will be covered later in this module.

Module P

Observation G.4

Notice that while a linear map can transform vectors in various ways, linear maps always transform parallelograms into parallelograms, and these areas are always transformed by the same factor: in the case of $B = \begin{bmatrix} 2 & 3 \\ 0 & 4 \end{bmatrix}$, this factor is 8.

$$B\vec{\mathbf{e}}_2 = \begin{bmatrix} 3 \\ 4 \end{bmatrix}$$

$$B \begin{bmatrix} \frac{3}{4} \\ \frac{1}{2} \end{bmatrix} = 4 \begin{bmatrix} \frac{3}{4} \\ \frac{1}{2} \end{bmatrix}$$

$$B\vec{\mathbf{e}}_1 = \begin{bmatrix} 2 \\ 0 \end{bmatrix}$$

$$B \begin{bmatrix} 1 \\ 0 \end{bmatrix} = 2 \begin{bmatrix} 1 \\ 0 \end{bmatrix}$$
Since this change in area is always the same for a given linear map, it will be equal to the value of the transformed unit square (which begins with area 1).

Definition G.10

The **determinant** is the unique function $\det : M_{n,n} \to \mathbb{R}$ satisfying these properties:

P1: $\det(I) = 1$

P2: $\det(A) = 0$ whenever two columns of the matrix are identical.

P3: $\det[\cdots \;\; c\vec{\mathbf{v}} \;\; \cdots] = c \det[\cdots \;\; \vec{\mathbf{v}} \;\; \cdots]$, assuming no other columns change.

P4: $\det[\cdots \;\; \vec{\mathbf{v}} + \vec{\mathbf{w}} \;\; \cdots] = \det[\cdots \;\; \vec{\mathbf{v}} \;\; \cdots] + \det[\cdots \;\; \vec{\mathbf{w}} \;\; \cdots]$, assuming no other columns change.

Note that these last two properties together can be phrased as "The determinant is linear in each column."

Linear Algebra

Lewis

Module I
Module E
Module V
Module A
Module M
Module G
Module P

Observation G.11

The determinant must also satisfy other properties. Consider $\det([\vec{\mathbf{v}} \quad \vec{\mathbf{w}} + c\vec{\mathbf{v}}])$ and $\det([\vec{\mathbf{v}} \quad \vec{\mathbf{w}}])$.
The base of both parallelograms is $\vec{\mathbf{v}}$, while the height has not changed, so the determinant does not change either. This can also be proven using the other properties of the determinant:

$$\det([\vec{\mathbf{v}} + c\vec{\mathbf{w}} \quad \vec{\mathbf{w}}]) = \det([\vec{\mathbf{v}} \quad \vec{\mathbf{w}}]) + \det([c\vec{\mathbf{w}} \quad \vec{\mathbf{w}}])$$
$$= \det([\vec{\mathbf{v}} \quad \vec{\mathbf{w}}]) + c\det([\vec{\mathbf{w}} \quad \vec{\mathbf{w}}])$$
$$= \det([\vec{\mathbf{v}} \quad \vec{\mathbf{w}}]) + c \cdot 0$$
$$= \det([\vec{\mathbf{v}} \quad \vec{\mathbf{w}}])$$

Module G
Module P

Fact G.14

To summarize, we've shown that the column versions of the three row-reducing operations a matrix may be used to simplify a determinant in the following way:

(a) Multiplying a column by a scalar multiplies the determinant by that scalar:

$$c \det([\cdots \ \vec{\mathbf{v}} \ \cdots]) = \det([\cdots \ c\vec{\mathbf{v}} \ \cdots])$$

(b) Swapping two columns changes the sign of the determinant:

$$\det([\cdots \ \vec{\mathbf{v}} \ \cdots \ \vec{\mathbf{w}} \ \cdots]) = -\det([\cdots \ \vec{\mathbf{w}} \ \cdots \ \vec{\mathbf{v}} \ \cdots])$$

(c) Adding a multiple of a column to another column does not change the determinant:

$$\det([\cdots \ \vec{\mathbf{v}} \ \cdots \ \vec{\mathbf{w}} \ \cdots]) = \det([\cdots \ \vec{\mathbf{v}} + c\vec{\mathbf{w}} \ \cdots \ \vec{\mathbf{w}} \ \cdots])$$

Observation G.35

Another option is to take advantage of the fact that the determinant is linear in each row or column. This approach is called **Laplace expansion** or **cofactor expansion**.

For example, since $\begin{bmatrix} 1 & 2 & 4 \end{bmatrix} = 1 \begin{bmatrix} 1 & 0 & 0 \end{bmatrix} + 2 \begin{bmatrix} 0 & 1 & 0 \end{bmatrix} + 4 \begin{bmatrix} 0 & 0 & 1 \end{bmatrix}$,

$$\det \begin{bmatrix} 2 & 3 & 5 \\ -1 & 3 & 5 \\ 1 & 2 & 4 \end{bmatrix} = 1 \det \begin{bmatrix} 2 & 3 & 5 \\ -1 & 3 & 5 \\ 1 & 0 & 0 \end{bmatrix} + 2 \det \begin{bmatrix} 2 & 3 & 5 \\ -1 & 3 & 5 \\ 0 & 1 & 0 \end{bmatrix} + 4 \det \begin{bmatrix} 2 & 3 & 5 \\ -1 & 3 & 5 \\ 0 & 0 & 1 \end{bmatrix}$$

$$= -1 \det \begin{bmatrix} 5 & 3 & 2 \\ 5 & 3 & -1 \\ 0 & 0 & 1 \end{bmatrix} - 2 \det \begin{bmatrix} 2 & 5 & 3 \\ -1 & 5 & 3 \\ 0 & 0 & 1 \end{bmatrix} + 4 \det \begin{bmatrix} 2 & 3 & 5 \\ -1 & 3 & 5 \\ 0 & 0 & 1 \end{bmatrix}$$

$$= -\det \begin{bmatrix} 5 & 3 \\ 5 & 3 \end{bmatrix} - 2 \det \begin{bmatrix} 2 & 5 \\ -1 & 5 \end{bmatrix} + 4 \det \begin{bmatrix} 2 & 3 \\ -1 & 3 \end{bmatrix}$$

Linear Algebra

Clontz & Lewis

Module I
Module E
Module V
Module A
Module M
Module G
Module P

Observation G.36

Applying Laplace expansion to a 2×2 matrix yields a short formula you may have seen:

$$\det \begin{bmatrix} a & b \\ c & d \end{bmatrix} = a \det \begin{bmatrix} 1 & 0 \\ c & d \end{bmatrix} + b \det \begin{bmatrix} 0 & 1 \\ c & d \end{bmatrix} = a \det \begin{bmatrix} 1 & 0 \\ c & d \end{bmatrix} - b \det \begin{bmatrix} 1 & 0 \\ d & c \end{bmatrix} = ad - bc.$$

There are formulas for the determinants of larger matrices, but they can be pretty tedious to use. For example, writing out a formula for a 4×4 determinant would require 24 different terms!

$$\det \begin{bmatrix} a_{11} & a_{12} & a_{13} & a_{14} \\ a_{21} & a_{22} & a_{23} & a_{24} \\ a_{31} & a_{32} & a_{33} & a_{34} \\ a_{41} & a_{42} & a_{43} & a_{44} \end{bmatrix} = a_{11}(a_{22}(a_{33}a_{44} - a_{43}a_{34}) - a_{23}(a_{32}a_{44} - a_{42}a_{34}) + \ldots) + \ldots$$

So this is why we either use Laplace expansion or row/column operations directly.

Observation G.42

Consider the linear transformation $A : \mathbb{R}^2 \to \mathbb{R}^2$ given by the matrix $A = \begin{bmatrix} 2 & 2 \\ 0 & 3 \end{bmatrix}$.
It is easy to see geometrically that

$$A \begin{bmatrix} 1 \\ 0 \end{bmatrix} = \begin{bmatrix} 2 & 2 \\ 0 & 3 \end{bmatrix} \begin{bmatrix} 1 \\ 0 \end{bmatrix} = \begin{bmatrix} 2 \\ 0 \end{bmatrix} = 2 \begin{bmatrix} 1 \\ 0 \end{bmatrix}$$

It is less obvious (but easily checked once you find it) that

$$A \begin{bmatrix} 2 \\ 1 \end{bmatrix} = \begin{bmatrix} 2 & 2 \\ 0 & 3 \end{bmatrix} \begin{bmatrix} 2 \\ 1 \end{bmatrix} = \begin{bmatrix} 6 \\ 3 \end{bmatrix} = 3 \begin{bmatrix} 2 \\ 1 \end{bmatrix}$$

Definition G.43

Let $A \in M_{n,n}$. An **eigenvector** for A is a vector $\vec{\mathbf{x}} \in \mathbb{R}^n$ such that $A\vec{\mathbf{x}}$ is parallel to $\vec{\mathbf{x}}$.
In other words, $A\vec{\mathbf{x}} = \lambda\vec{\mathbf{x}}$ for some scalar λ. If $\vec{\mathbf{x}} \neq \vec{\mathbf{0}}$, then we say $\vec{\mathbf{x}}$ is a **nontrivial eigenvector** and we call this λ an **eigenvalue** of A.

Linear Algebra

Module P

Fact G.45

The eigenvalues λ for a matrix A are the values that make $A - \lambda I$ non-invertible.

Thus the eigenvalues λ for a matrix A are the solutions to the equation

$$\det(A - \lambda I) = 0.$$

Linear Algebra

Clontz &
Lewis

Module I
Module E
Module V
Module A
Module M
Module G
Module P

Definition G.46

The expression $\det(A - \lambda I)$ is called **characteristic polynomial** of A.

For example, when $A = \begin{bmatrix} 1 & 2 \\ 3 & 4 \end{bmatrix}$, we have

$$A - \lambda I = \begin{bmatrix} 1 & 2 \\ 3 & 4 \end{bmatrix} - \begin{bmatrix} \lambda & 0 \\ 0 & \lambda \end{bmatrix} = \begin{bmatrix} 1 - \lambda & 2 \\ 3 & 4 - \lambda \end{bmatrix}$$

Thus the characteristic polynomial of A is

$$\det \begin{bmatrix} 1 - \lambda & 2 \\ 3 & 4 - \lambda \end{bmatrix} = (1 - \lambda)(4 - \lambda) - (2)(3) = \lambda^2 - 5\lambda - 2$$

and its eigenvalues are the solutions to $\lambda^2 - 5\lambda - 2 = 0$.

Module G
Module P
Section 1
Section 2
Section 3
Section 4

Definition P.1

In geology, a **phase** is any physically separable material in the system, such as various minerals or liquids.

A **component** is a chemical compound necessary to make up the phases; these are usually oxides such as Calcium Oxide (CaO) or Silicone Dioxide (SiO_2).

In a typical application, a geologist knows how to build each phase from the components, and is interested in determining reactions among the different phases.

Linear Algebra

Clontz &
Lewis

Module I
Module E
Module V
Module A
Module M
Module G
Module P
Section 1
Section 2
Section 3
Section 4

Observation P.2

Consider the 3 components

$$\vec{c}_1 = \mathrm{CaO} \quad \vec{c}_2 = \mathrm{MgO} \quad \text{and} \quad \vec{c}_3 = \mathrm{SiO}_2$$

and the 5 phases:

$$\vec{p}_1 = \mathrm{Ca_3MgSi_2O_8} \qquad \vec{p}_2 = \mathrm{CaMgSiO_4} \qquad \vec{p}_3 = \mathrm{CaSiO_3}$$
$$\vec{p}_4 = \mathrm{CaMgSi_2O_6} \qquad \vec{p}_5 = \mathrm{Ca_2MgSi_2O_7}$$

Geologists already know (or can easily deduce) that

$$\vec{p}_1 = 3\vec{c}_1 + \vec{c}_2 + 2\vec{c}_3 \qquad \vec{p}_2 = \vec{c}_1 + \vec{c}_2 + \vec{c}_3 \qquad \vec{p}_3 = \vec{c}_1 + 0\vec{c}_2 + \vec{c}_3$$
$$\vec{p}_4 = \vec{c}_1 + \vec{c}_2 + 2\vec{c}_3 \qquad \vec{p}_5 = 2\vec{c}_1 + \vec{c}_2 + 2\vec{c}_3$$

since, for example:

$$\vec{c}_1 + \vec{c}_3 = \mathrm{CaO} + \mathrm{SiO}_2 = \mathrm{CaSiO}_3 = \vec{p}_3$$

Module G
Module P
Section 1
Section 2
Section 3
Section 4

Example P.8

Consider this small network with only three pages. Let x_1, x_2, x_3 be the importance of the three pages respectively.
1. x_1 splits its endorsement in half between x_2 and x_3

2. x_2 sends all of its endorsement to x_1

3. x_3 sends all of its endorsement to x_2.

This corresponds to the **page rank system**

$$
\begin{aligned}
x_2 &= x_1 \\
\tfrac{1}{2}x_1 + x_3 &= x_2 \\
\tfrac{1}{2}x_1 &= x_3
\end{aligned}
$$

Linear Algebra

Clontz &
Lewis

Module I
Module E
Module V
Module A
Module M
Module G
Module P
Section 1
Section 2
Section 3
Section 4

Observation P.9

$$x_2 \quad = x_1$$

$$\frac{1}{2}x_1 \quad + x_3 = x_2$$

$$\frac{1}{2}x_1 \quad = x_3$$

$$\begin{bmatrix} 0 & 1 & 0 \\ \frac{1}{2} & 0 & 1 \\ \frac{1}{2} & 0 & 0 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \\ x_3 \end{bmatrix} = \begin{bmatrix} x_1 \\ x_2 \\ x_3 \end{bmatrix}$$

By writing this linear system in terms of matrix multiplication, we obtain the **page rank matrix** $A = \begin{bmatrix} 0 & 1 & 0 \\ \frac{1}{2} & 0 & 1 \\ \frac{1}{2} & 0 & 0 \end{bmatrix}$ and page rank vector $\vec{\mathbf{x}} = \begin{bmatrix} x_1 \\ x_2 \\ x_3 \end{bmatrix}$.

Thus, computing the importance of pages on a network is equivalent to solving the matrix equation $A\vec{\mathbf{x}} = 1\vec{\mathbf{x}}$.

Section 4

Activity P.18 (~5 min) Consider the representation of a simple truss pictured below. All of the seven struts are of equal length, affixed to two anchor points applying a normal force to nodes C and E, and with a $10000N$ load applied to the node given by D.
Which of the following must hold for the truss to be stable?

a) All of the struts will experience compression.

b) All of the struts will experience tension.

c) Some of the struts will be compressed, but others will be tensioned.

Module P
Section 1
Section 2
Section 3
Section 4

Observation P.19

Since the forces must balance at each node for the truss to be stable, some of the struts will be compressed, while others will be tensioned.
By finding vector equations that must hold at each node, we may determine many of the forces at play.

Remark P.20

For example, at the bottom left node there are 3 forces acting.
Let $\vec{\mathbf{F}}_{CA}$ be the force on C given by the compression/tension of the strut CA, let $\vec{\mathbf{F}}_{CD}$ be defined similarly, and let $\vec{\mathbf{N}}_C$ be the normal force of the anchor point on C.

For the truss to be stable, we must have

$$\vec{\mathbf{F}}_{CA} + \vec{\mathbf{F}}_{CD} + \vec{\mathbf{N}}_C = \vec{\mathbf{0}}.$$

Module E

Module V

Module A

Module M

Module G

Module P
Section 1
Section 2
Section 3
Section 4

Observation P.31

Thus we know the truss must satisfy the following conditions.

$$x_1 = x_2 = x_5 = -5882.4$$
$$x_3 = x_4 = 5882.4$$
$$x_6 = x_7 = 2886.8 + z_1$$
$$y_1 = -z_1$$
$$y_2 = z_2 = 5000$$

In particular, the negative x_1, x_2, x_5 represent tension (forces pointing into the nodes), and the postive x_3, x_4 represent compression (forces pointing out of the nodes). The vertical normal forces $y_2 + z_2$ counteract the 10000 load.

Definition P.32

Cryptography is the practice and study of encoding messages so that only the intended receiver can decode them.

For example, the ROT13 cipher both encodes and decodes messages by shifting each letter thirteen places in the alphabet, cycling from Z back to A. This may be accomplished by converting each letter to a number

$$A \equiv 1, B \equiv 2, \ldots, Y \equiv 25, Z \equiv 0$$

and adding 13 (modulo 26):

$$\texttt{HELLO} \equiv \begin{bmatrix} 8 \\ 5 \\ 12 \\ 12 \\ 15 \end{bmatrix} \underset{ROT13}{\leftrightarrow} \begin{bmatrix} 21 \\ 18 \\ 25 \\ 25 \\ 2 \end{bmatrix} \equiv \texttt{URYYB}$$

Section 4

Activity P.33 *(∼10 min)* Suppose your instructor saw another student passing a note that said

MFUT DIFBU PO UIF UFTU

How could the instructor decode this message, taking advantage of the fact that THE is one of the most commonly used words in the English language?

Linear Algebra

Clontz & Lewis

Module I
Module E
Module V
Module A
Module M
Module G
Module P
Section 1
Section 2
Section 3
Section 4

Observation P.34
Frequency analysis is a common tool used in breaking **substitution ciphers** that simply substitute letters for other letters. In the message

MFUT DIFBU PO UIF UFTU

the common word THE is encoded as UIF, and the most common letters in the English language E,T match the most common letters used in this message: F,U.

This suggests the following partial decryption:

-ET- -HE-T -- THE TE-T

By considering the context, or the fact that all letters were shifted the same amount, or perhaps by an analysis of other messages sent using the same code, the completed message may be revealed:

LETS CHEAT ON THE TEST

Module M
Module G
Module P
Section 1
Section 2
Section 3
Section 4

Remark P.35

To defeat naive frequency analysis attacks, one method that may be used is to create a rule that converts groups of letters into new groups of letters, rather than converting single letters individually.

So to send the message

```
LETS CHEAT ON THE TEST
```

one might first break it into three-letter pieces.

```
LET SCH EAT ONT HET EST
```
