Definition P.1
In geology, a **phase** is any physically separable material in the system, such as various minerals or liquids.

A **component** is a chemical compound necessary to make up the phases; these are usually oxides such as Calcium Oxide (CaO) or Silicone Dioxide (SiO_2).

In a typical application, a geologist knows how to build each phase from the components, and is interested in determining reactions among the different phases.

Observation P.2

Consider the 3 components

$$\vec{c}_1 = \mathrm{CaO} \quad \vec{c}_2 = \mathrm{MgO} \quad \text{and } \vec{c}_3 = \mathrm{SiO}_2$$

and the 5 phases:

$$\vec{p}_1 = \mathrm{Ca_3MgSi_2O_8} \qquad \vec{p}_2 = \mathrm{CaMgSiO_4} \qquad \vec{p}_3 = \mathrm{CaSiO_3}$$
$$\vec{p}_4 = \mathrm{CaMgSi_2O_6} \qquad \vec{p}_5 = \mathrm{Ca_2MgSi_2O_7}$$

Geologists already know (or can easily deduce) that

$$\vec{p}_1 = 3\vec{c}_1 + \vec{c}_2 + 2\vec{c}_3 \qquad \vec{p}_2 = \vec{c}_1 + \vec{c}_2 + \vec{c}_3 \qquad \vec{p}_3 = \vec{c}_1 + 0\vec{c}_2 + \vec{c}_3$$
$$\vec{p}_4 = \vec{c}_1 + \vec{c}_2 + 2\vec{c}_3 \qquad \vec{p}_5 = 2\vec{c}_1 + \vec{c}_2 + 2\vec{c}_3$$

since, for example:

$$\vec{c}_1 + \vec{c}_3 = \mathrm{CaO} + \mathrm{SiO}_2 = \mathrm{CaSiO}_3 = \vec{p}_3$$

The $700,000,000,000 Idea:

Links are endorsements.

1. A webpage is important if it is linked to (endorsed) by important pages.

2. A webpage distributes its importance equally among all the pages it links to (endorses).

Linear Algebra

Module P
Section 1
Section 2
Section 3
Section 4

Example P.8

Consider this small network with only three pages. Let x_1, x_2, x_3 be the importance of the three pages respectively.

1. x_1 splits its endorsement in half between x_2 and x_3

2. x_2 sends all of its endorsement to x_1

3. x_3 sends all of its endorsement to x_2.

This corresponds to the **page rank system**

$$\begin{aligned} x_2 \quad &= x_1 \\ \frac{1}{2}x_1 \ + x_3 &= x_2 \\ \frac{1}{2}x_1 \quad &= x_3 \end{aligned}$$

Linear Algebra

Clontz &
Lewis

Module P
Section 1
Section 2
Section 3
Section 4

Observation P.9

$$x_2 \quad = x_1$$

$$\frac{1}{2}x_1 \quad + x_3 = x_2$$

$$\frac{1}{2}x_1 \quad = x_3$$

$$\begin{bmatrix} 0 & 1 & 0 \\ \frac{1}{2} & 0 & 1 \\ \frac{1}{2} & 0 & 0 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \\ x_3 \end{bmatrix} = \begin{bmatrix} x_1 \\ x_2 \\ x_3 \end{bmatrix}$$

By writing this linear system in terms of matrix multiplication, we obtain the **page rank matrix** $A = \begin{bmatrix} 0 & 1 & 0 \\ \frac{1}{2} & 0 & 1 \\ \frac{1}{2} & 0 & 0 \end{bmatrix}$ and page rank vector $\vec{x} = \begin{bmatrix} x_1 \\ x_2 \\ x_3 \end{bmatrix}$.

Thus, computing the importance of pages on a network is equivalent to solving the matrix equation $A\vec{x} = 1\vec{x}$.

Definition P.32

Cryptography is the practice and study of encoding messages so that only the intended receiver can decode them.

For example, the ROT13 cipher both encodes and decodes messages by shifting each letter thirteen places in the alphabet, cycling from Z back to A. This may be accomplished by converting each letter to a number

$$A \equiv 1, B \equiv 2, \ldots, Y \equiv 25, Z \equiv 0$$

and adding 13 (modulo 26):

Activity P.33 *(∼10 min)* Suppose your instructor saw another student passing a note that said

```
MFUT DIFBU PO UIF UFTU
```

How could the instructor decode this message, taking advantage of the fact that THE is one of the most commonly used words in the English language?

Observation P.34
Frequency analysis is a common tool used in breaking **substitution ciphers** that simply substitute letters for other letters. In the message

MFUT DIFBU PO UIF UFTU

the common word THE is encoded as UIF, and the most common letters in the English language E,T match the most common letters used in this message: F,U.

This suggests the following partial decryption:

-ET- -HE-T -- THE TE-T

By considering the context, or the fact that all letters were shifted the same amount, or perhaps by an analysis of other messages sent using the same code, the completed message may be revealed:

LETS CHEAT ON THE TEST

Remark P.35
To defeat naive frequency analysis attacks, one method that may be used is to
create a rule that converts groups of letters into new groups of letters, rather than
converting single letters individually.

So to send the message

                    LETS CHEAT ON THE TEST

one might first break it into three-letter pieces.

Remark P.36

Each piece then may be converted to a Euclidean vector in $\mathbb{R}^3$, which may be linearly transformed by multiplying by a matrix A with $\det(A) = 1 = \det(A^{-1})$.

For $A = \begin{bmatrix} 3 & -2 & -3 \\ -2 & 3 & 0 \\ -1 & 0 & 2 \end{bmatrix}$:

$$\text{LET} \equiv \begin{bmatrix} 12 \\ 5 \\ 20 \end{bmatrix} \rightarrow \begin{bmatrix} 3 & -2 & -3 \\ -2 & 3 & 0 \\ -1 & 0 & 2 \end{bmatrix} \begin{bmatrix} 12 \\ 5 \\ 20 \end{bmatrix} = \begin{bmatrix} -34 \\ -9 \\ 28 \end{bmatrix}$$

Remark P.37

The resulting vector may be converted back into English letters by adding multiples of 26 to each component to obtain numbers between 0 and 25.

$$\begin{bmatrix} -34 \\ -9 \\ 28 \end{bmatrix} \equiv \begin{bmatrix} -34 + 52 \\ -9 + 26 \\ 28 - 26 \end{bmatrix} = \begin{bmatrix} 18 \\ 17 \\ 2 \end{bmatrix} \equiv \text{RPB}$$

This process may be done all at once by converting the entire message into a matrix:

$$\texttt{LET SCH } \ldots \equiv \begin{bmatrix} 12 & 19 & \\ 5 & 3 & \ldots \\ 20 & 8 & \end{bmatrix}$$

$$\rightarrow \begin{bmatrix} 3 & -2 & -3 \\ -2 & 3 & 0 \\ -1 & 0 & 2 \end{bmatrix} \begin{bmatrix} 12 & 19 & \\ 5 & 3 & \ldots \\ 20 & 8 & \end{bmatrix} = \begin{bmatrix} -34 & 27 & \\ -9 & -29 & \ldots \\ 28 & -3 & \end{bmatrix}$$
